SAMPLE REGISTRATION SYSTEM
STATISTICAL REPORT 2024

OFFICE OF THE REGISTRAR GENERAL &
CENSUS COMMISSIONER, INDIA
MINISTRY OF HOME AFFAIRS
GOVERNMENT OF INDIA
NEW DELHI

P R E F A C E

The Sample Registration System (SRS) Statistical Report 2024 contains estimates of various demographic, fertility and mortality indicators based on the data collected through the SRS sample survey. SRS in India is one of the largest demographic surveys in the world covering about 8.9 million sample population. It is carried out by the Office of Registrar General & Census Commissioner, India with an objective of providing reliable annual estimates of Birth Rate, Death Rate, Infant Mortality Rate and various other fertility and mortality indicators. SRS has been serving as the main source of information on fertility and mortality at the State and National levels, from 1971 onwards.

2. The SRS Statistical Report includes data on population composition by broad age groups, sex and marital status. Various fertility indicators like Crude Birth Rate, Total Fertility Rate, Age-Specific Fertility Rate, General Fertility Rate, Mean Age of Fertility and many more are also estimated under SRS. All these indicators have been included in this report. Further, this report also contains estimates of indicators like Crude Death Rate, Infant Mortality Rate, Under-Five Mortality Rate, Age-Specific Death Rate, Neo-natal Mortality Rate etc. which provide comprehensive information on mortality. Certain other indicators of demographic interest such as mean age at effective marriage for females, interval between current and previous live birth and also distribution of live births by birth order have continued to form part of the SRS report. The sex ratio at birth has also been estimated in this Report as in the past. The indicators in this report are brought out for India and bigger States/UTs (with population of 10 million and above) separately for rural and urban areas. Considering the demand from users the additional indicator of Survival to Age 5 has also been included since 2021. Furthermore, the Under-Five Mortality Rate (U5MR) by NSS Natural Division is also being published in the report for the first time.

3. This report has been prepared by the officials of the SRS wing of VS Division led by Ms. Salini V K, Deputy Registrar General under the guidance of Sh. Sanjeev Kumar, Additional Registrar General. In particular, I wish to place on record the efforts put in by Ms. Salini V K, Deputy Registrar General, Ms. Preeti Tiwari, Senior Research Officer, and Sh. Ravi Kant, Assistant Director in bringing out this publication. This study has been made possible with the active involvement of staff and officers of the Directorates of Census Operations, SRS Wing of the Vital Statistics Division, IT Division and Map Division at the headquarters. I am thankful to all of them for their efforts and support.

Chapter 2 - Population Composition	13-56
Chapter 3 - Estimates of Fertility Indicators	57-125
Chapter 4 - Estimates of Mortality Indicators	127-191

Detailed Tables

1.	Percentage distribution of estimated population by age-group, Sex and Residence, 2024	193-204
2.	Percentage distribution of population by Sex, Marital Status and Age-group, 2024	205-227
3.	Fertility Indicators, 2024	228-234
4.	Fertility indicators by Level of Education of Women, 2024	235-257
5.	Percentage distribution of live births by Order of Birth, 2024	258-263
6.	Percentage distribution of current live births by Birth Interval, 2024	264-265
7.	Percentage distribution of current live births by Birth Interval and Birth Order, 2024	266-271
8.	Age-Specific Death Rate by Sex and Residence, 2024	272-294
9.	Child (Aged 0-4 years) and Infant Mortality Indicators, 2024	272-294
10.	Percentage distribution of deaths to total deaths by Residence, Sex and Age-group, 2024	295-306
11.	Birth Rate, Death Rate Infant Mortality Rate and Under-five Mortality Rate by NSS Natural Division, 2024	307-309

Tables on Trend

12.	Annual estimates of Birth Rate by Residence, India and bigger States/UTs, 2019-24	311
13.	Annual estimates of Death Rate by Sex, India and bigger States/UTs, 2019-24	312
14.	Annual estimates of Infant Mortality Rate by Sex, India and bigger States/UTs, 2019-24	313
15.	Annual estimates of Total Fertility Rate by Residence, India and bigger States/UTs, 2019-24	314
16.	Sex Ratio at Birth (female per 1000 male) by Residence, India and bigger States/UTs, 2018-20 to 2022-24	315
17.	Percent of live births where the mothers received medical attention at delivery either at Government hospitals or at Private hospitals, India and bigger States/UTs, 2019-24	316
18.	Percent of deaths where medical attention received before death was either at Government hospitals or at Private hospitals, India and bigger States/UTs, 2019-24	317

D E F I N I T I O N S

Crude Birth Rate (CBR) = $\frac{\text{Number of live births during the year}}{\text{Mid-year population}} \times 1000$

Age-Specific Fertility Rate (ASFR) = $\frac{\text{Number of live births in a particular age-group}}{\text{Mid-year female population of the same age-group}} \times 1000$

General Fertility Rate (GFR) = $\frac{\text{Number of live births in a year}}{\text{Mid-year female population in the age-group (15-49) years}} \times 1000$

Total Fertility Rate (TFR) = $\frac{5 \times \sum_{15-19}^{45-49} \text{ASFR}}{1000}$

Gross Reproduction Rate (GRR) = $\frac{5 \times \sum_{15-19}^{45-49} \text{ASFR for female live births}}{1000}$

Age-Specific Marital Fertility Rate (ASMFR) = $\frac{\text{Number of live births in a particular age-group}}{\text{Mid-year married female population of the same age-group}} \times 1000$

General Marital Fertility Rate (GMFR) = $\frac{\text{Number of live births in a year}}{\text{Mid-year married female population in the age-group (15-49) year}} \times 1000$

Total Marital Fertility Rate (TMFR) = $\frac{5 \times \sum_{15-19}^{45-49} \text{ASMFR}}{1000}$

Crude Death Rate (CDR) = $\frac{\text{Number of deaths during the year}}{\text{Mid-year population}} \times 1000$

Age-Specific Mortality Rate (ASMR) = Number of deaths in a particular age-group / Mid-year population of the same age-group x 1000

Under-five Mortality Rate = The Under-Five Mortality is the probability ($_5q_0$) that a child born in a specific year or time period will die before reaching the age of five, subject to current Age-Specific Mortality Rates. It is expressed as a rate per 1,000 live births.

Infant Mortality Rate (IMR) = Number of infant deaths during the year / Number of live births during the year x 1000

Infant Mortality Rate comprises of two parts viz. Neo-natal Mortality Rate and Post Neo-natal Mortality Rate. The Neo-natal Mortality Rate also comprises of two parts viz. Early Neo-natal Mortality Rate and late Neo-natal Mortality Rate. These are defined as:

Neo-natal Mortality Rate (NMR) = Number of infant deaths of < than 29 days during the year / Number of live births during the year x 1000

Early Neo-natal Mortality Rate = Number of infant deaths of < than 7 days during the year / Number of live births during the year x 1000

Late Neo-natal Mortality Rate = Number of infant deaths of 7 days to < than 29 days during the year / Number of live births during the year x 1000

Post Neo-natal Mortality Rate (PNMR) = Number of infant deaths of 29 days to < than one year during the year / Number of live births during the year x 1000

Peri-natal Mortality Rate (PMR) = Number of still births and infant deaths of < than 7 days during the year / Number of live births and still births during the year x 1000

Still Birth Rate (SBR) = Number of still births during the year / Number of live births and still births during the year x 1000

FIGURES AT A GLANCE, INDIA - 2024

	Item	Total	Rural	Urban

Trend of Birth Rate, Death Rate, Infant Mortality Rate, Total Fertility Rate and Sex Ratio at Birth, India

EXECUTIVE SUMMARY

The Sample Registration System (SRS) is the largest demographic survey in the Country mandated to provide annual estimates of fertility as well as mortality indicators at the State and National level. The present Report contains data on fertility and mortality indicators for the year 2024 for India and bigger States/UTs. The estimates are segregated by residence and also by gender, wherever required.

2. The salient features of the report are summarized below.

- ❖ The Crude Birth Rate (CBR) at the National level during 2024 stands at 18.3 exhibiting a decline of 0.1 points over 2023. Among the bigger States/UTs, the maximum CBR has been reported in Bihar (26.8) and the minimum in Kerala (11.1).

- ❖ There has been a decline of 1.4 points in the CBR for the Country from 2019 to 2024. The corresponding decline in rural CBR is 1.2 points and in urban CBR is of 1.7 points.

- ❖ The Crude Death Rate (CDR) for the Country is 6.4 in 2024. Among the bigger States/UTs, the maximum CDR has been reported for Chhattisgarh (8.4) and the minimum for Delhi (4.5).

- ❖ The Infant Mortality Rate (IMR) declined by one point to 24 in 2024 at the National level. Among the bigger States/UTs, Chhattisgarh recorded the highest IMR at 36, while Kerala reported the lowest at 8.

- ❖ IMR for the Country stands at 24 in 2024 from 30 in 2019, a decline of 6 points over last 5 years and an annual average decline of about 1.0 point. The corresponding decline in rural IMR has been to the tune of 7 points (34 in 2019 to 27 in 2024) against a decline of 3 points in urban IMR (20 in 2019 to 17 in 2024). Both the genders have shown decline during the period 2019-24.

- ❖ Despite this decline, one in every 42 infants at the National level, one in every 37 infants in rural areas and one in every 59 infants in urban areas still die within one year of life.

- ❖ In 2024, U5MR for the Country has shown a decline of 1 point from 2024 (28 in 2024 against 29 in 2023). There has been a decline of 2 points in male U5MR and of 1 point in female U5MR respectively during the corresponding period.

- ❖ Sex Ratio at Birth for the Country has gone up by 1 point to 918 in 2022-24 from 917 in 2021-23. Chhattisgarh and Kerala have reported the highest Sex Ratio at Birth at 978 and 974 respectively, while Uttarakhand has the lowest (872). Sex Ratio at Birth for Rural and Urban areas were 914 and 928 respectively during 2022-24.

- ❖ The Total Fertility Rate (TFR) for the Country is estimated at 1.9 in 2024. In the same year, Bihar recorded the highest TFR at 2.9, while Delhi had the lowest at 1.2. Notably, the National TFR has fallen below the replacement level of 2.1.

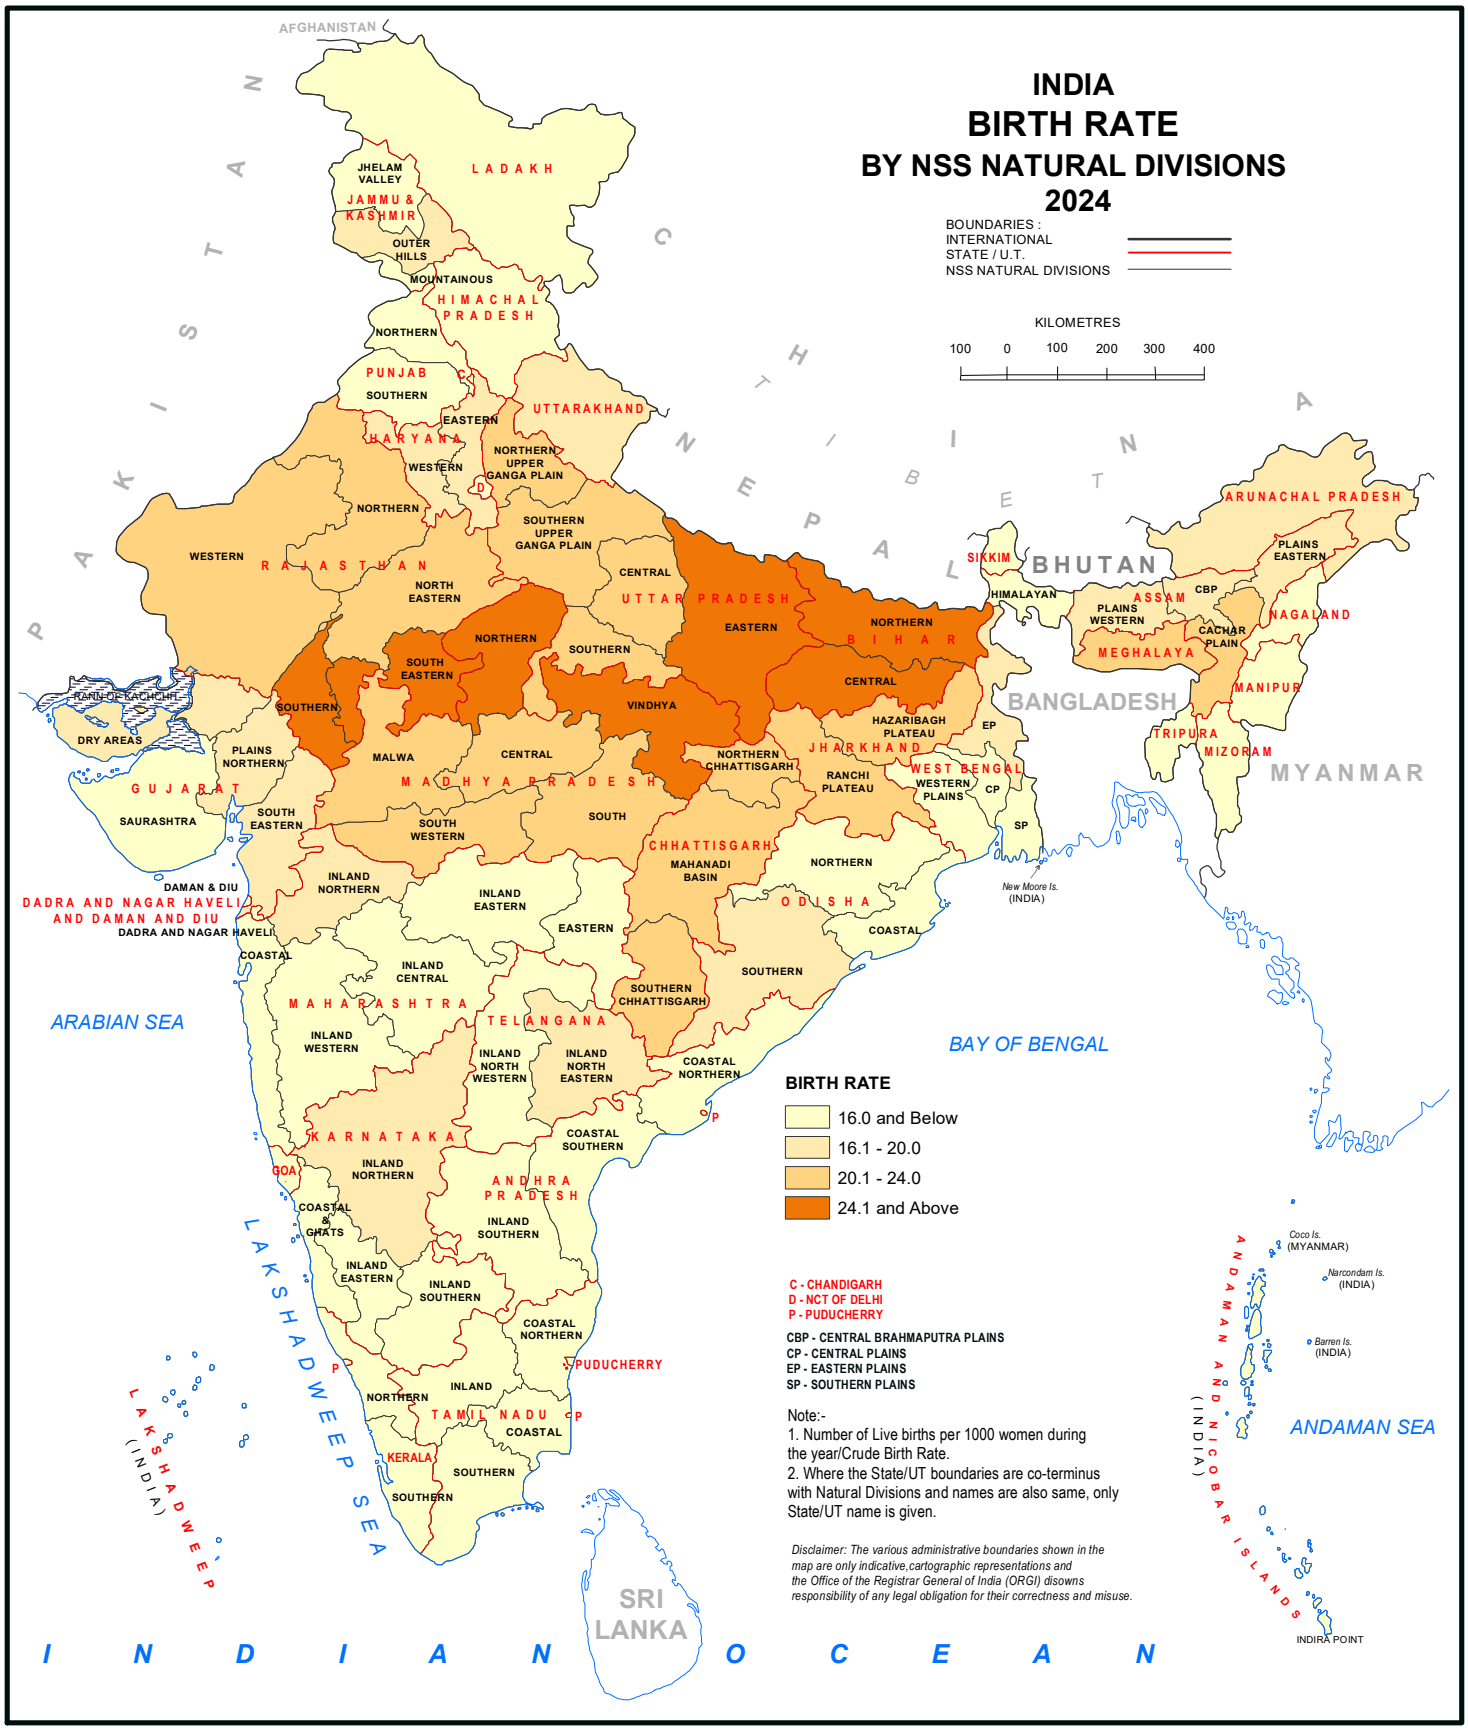

Several states/UTs—including Delhi (1.2), Kerala (1.3), Andhra Pradesh (1.4), Jammu & Kashmir (1.4), Punjab (1.4), Himachal Pradesh (1.5), Karnataka (1.5), Maharashtra (1.4), Tamil Nadu (1.3), West Bengal (1.3), Telangana (1.5), Odisha (1.6), Gujarat (1.7), Uttarakhand (1.7), Assam (1.9) and Haryana (1.9), have also reached TFR below the replacement level.

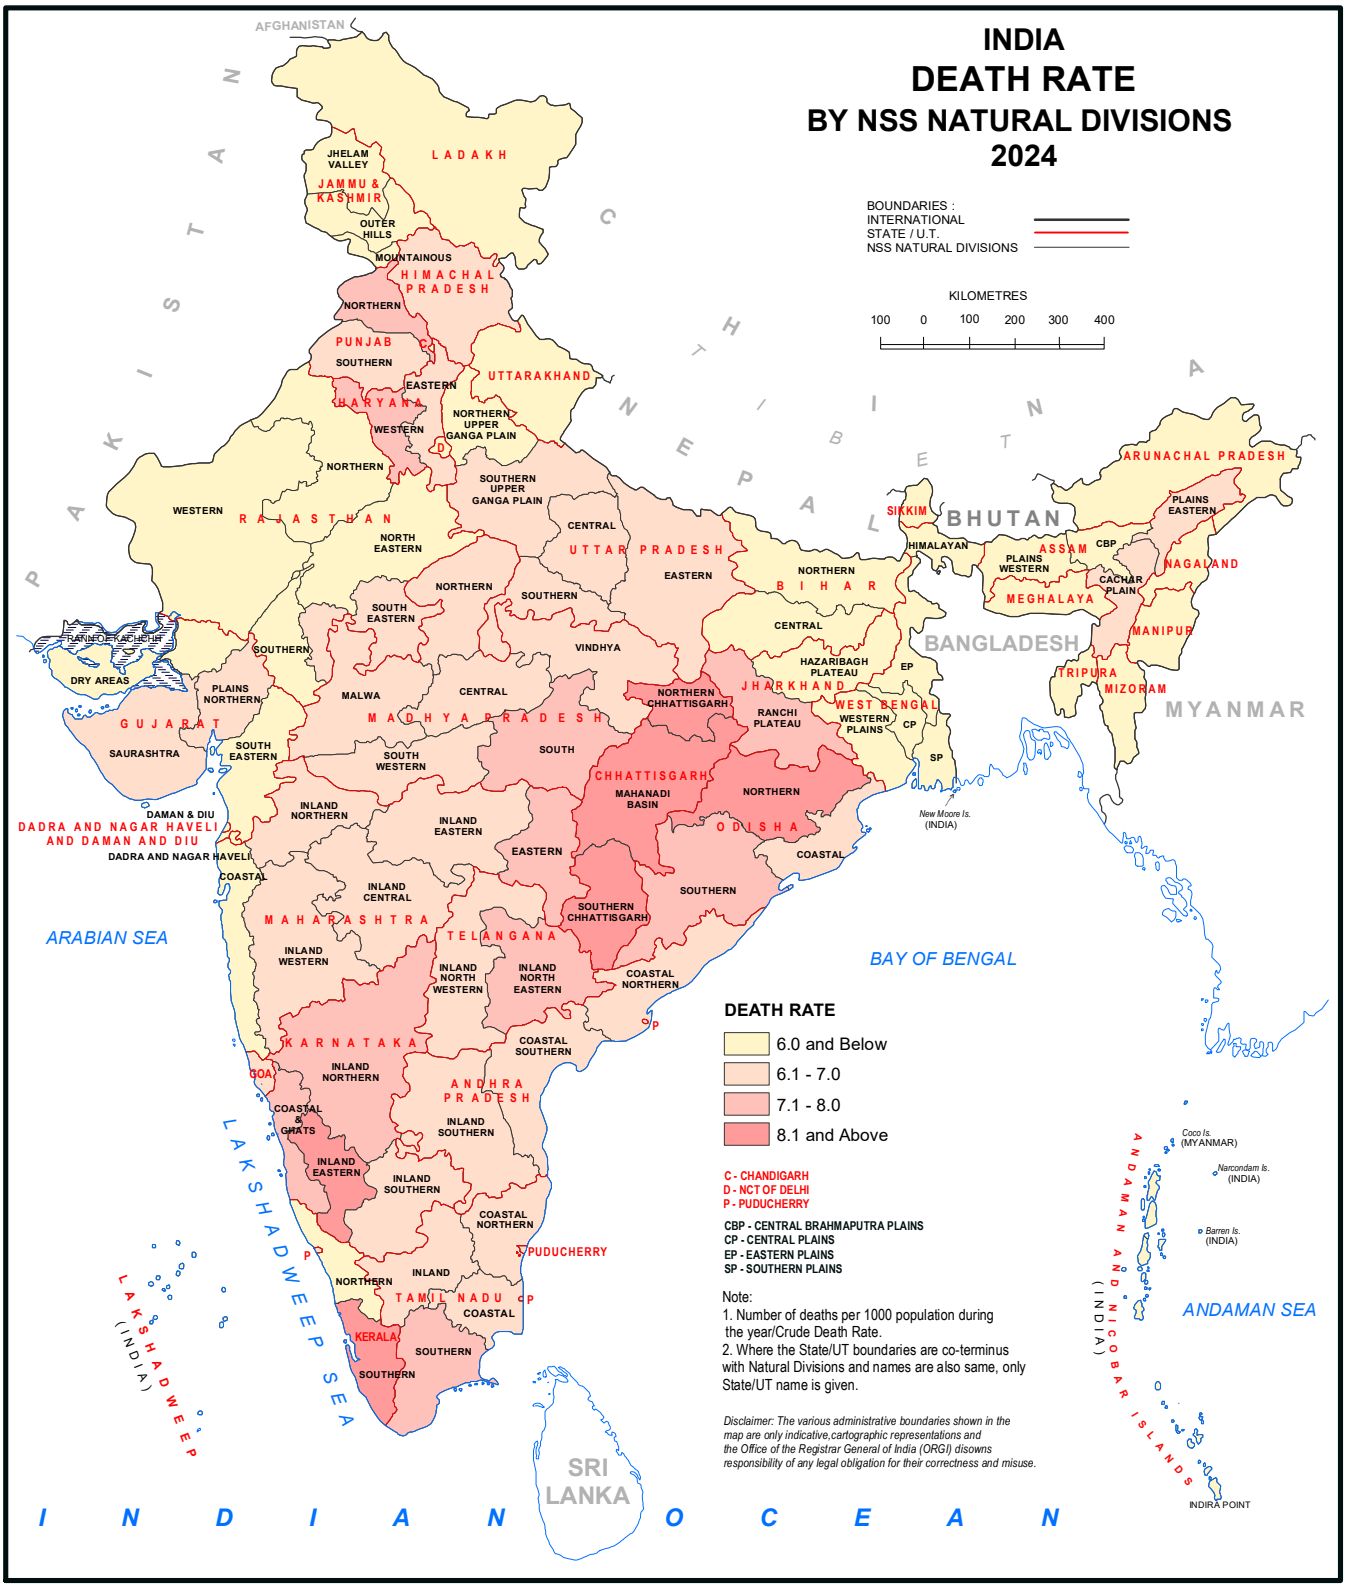

- In 2024, at the National level, rural women (TFR 2.1) have, on an average, more children than urban women (TFR 1.5).

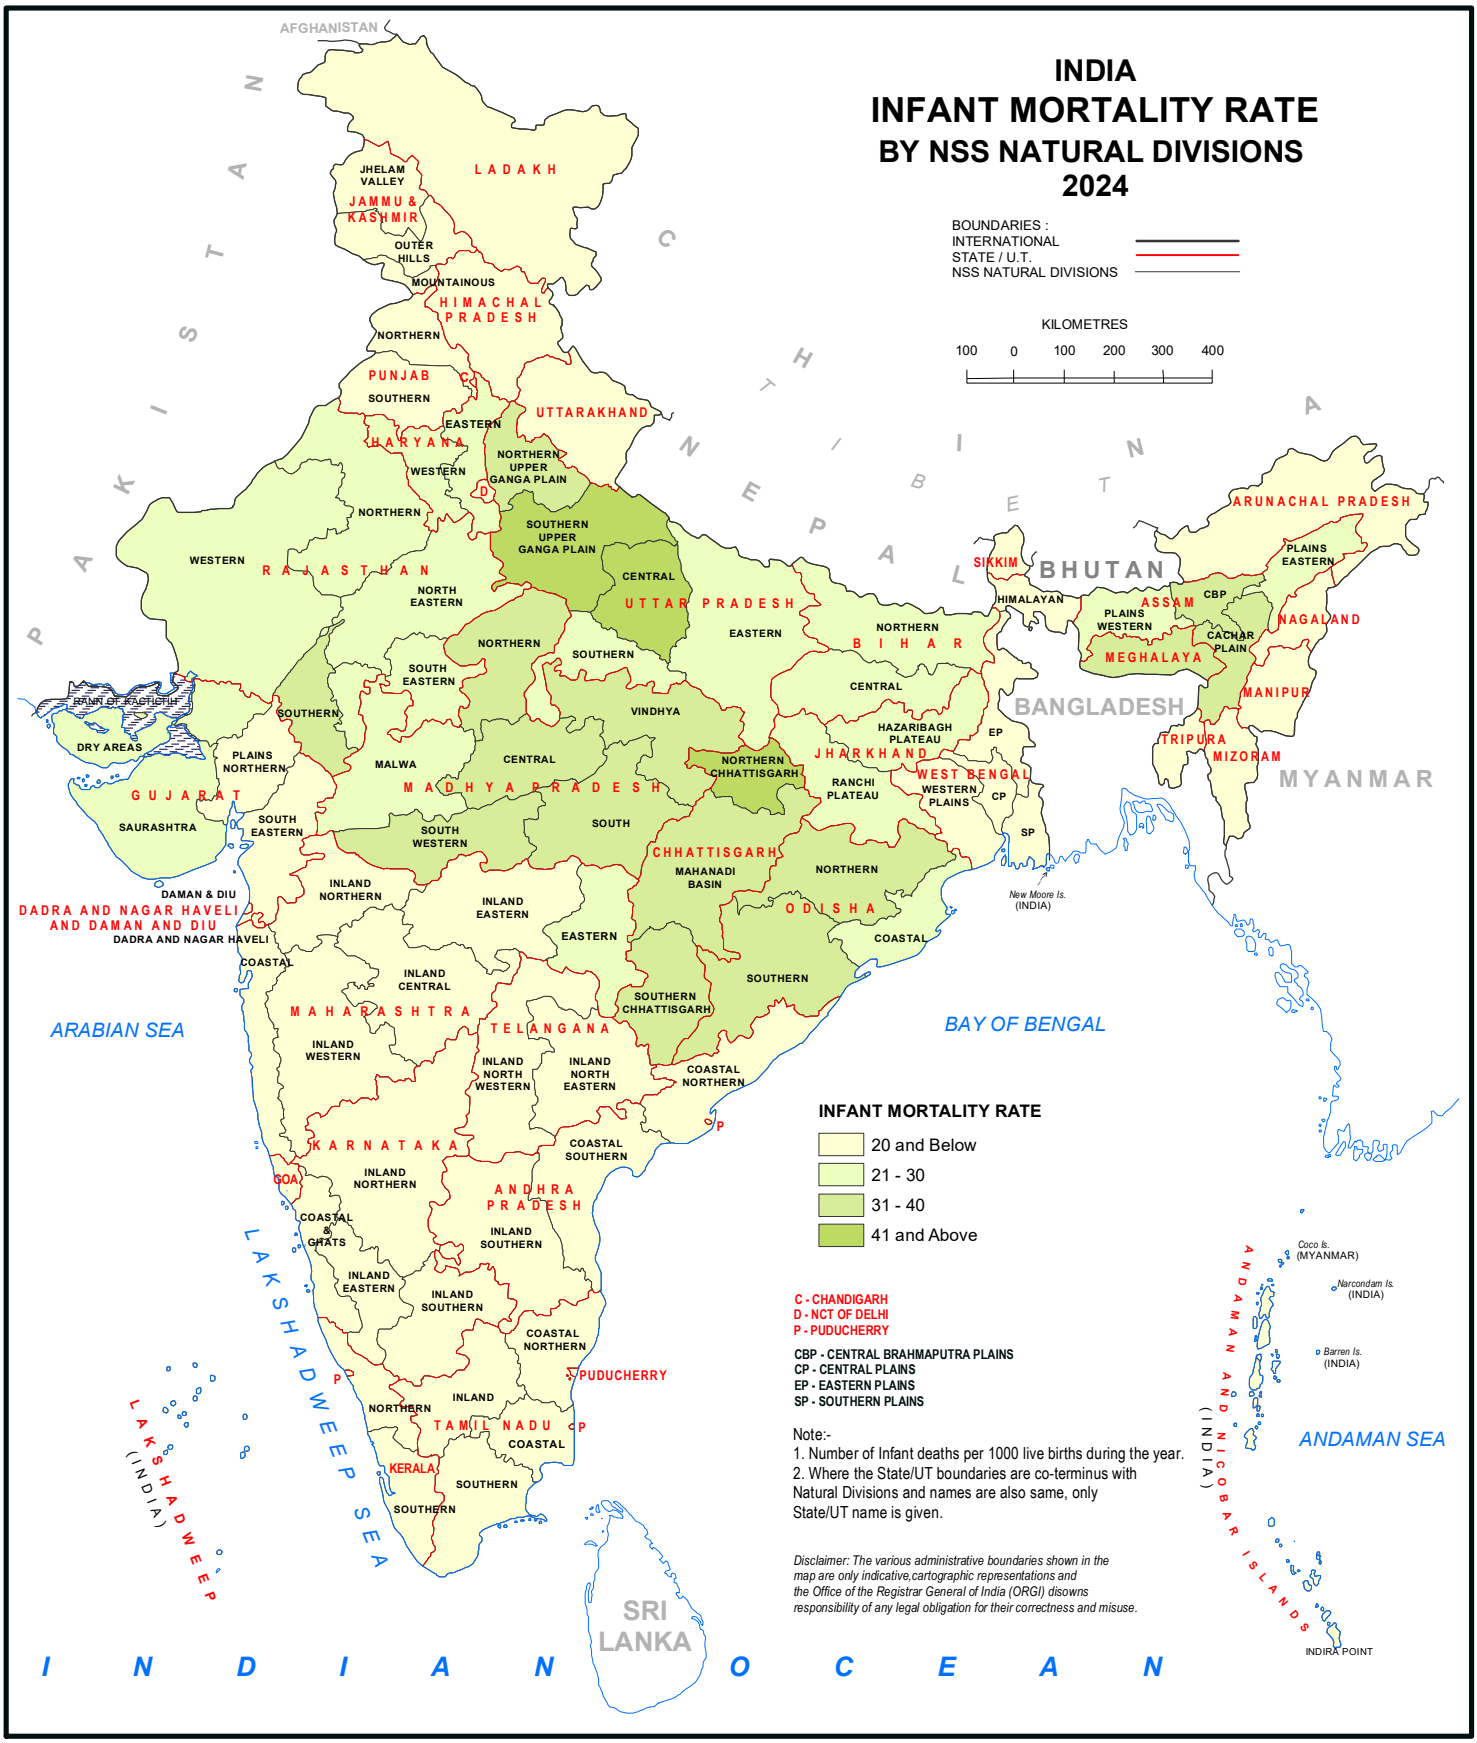

- During 2019–2024, the TFR declined by 0.2 points at the National level, as well as across both rural and urban areas.

- In case of about 95.4 percent live births, the mothers have received the medical attention at delivery either at Government hospital or at Private hospital in 2024.

- In 40.2 percent cases of deaths, the deceased have received medical attention before death, either at Government hospital or at Private hospital in 2024.

CHAPTER – 1

INTRODUCTION

Registration of births and deaths is an important source for demographic data for socio-economic development and population control in developing countries. The data on population growth, fertility and mortality serves as the prime constituent for population projections. Apart from these vital indicators, an adequate evaluation of a number of programs in the health sector, including family planning, maternal and reproductive health, immunization programs, is dependent upon the availability of accurate, up-to-date fertility and mortality data. In India, the need for dependable demographic data was felt soon after independence heralding the era of five-year planning. The registration of births and deaths started on voluntary basis and there was no uniformity in statistical returns resulting in both under-registration and incomplete coverage. In order to unify the Civil Registration activities, the Registration of Births & Deaths Act, 1969 was enacted. Despite having the registration of birth & death compulsory under the statute and various efforts taken by Office of Registrar General of India for complete birth & death registration, the level of registration of births and deaths under the Act is improving but, continued to be under-reported in some States/UTs. With a view to generate reliable and continuous data on these indicators, the Office of Registrar General of India, initiated the scheme of sample registration of births and deaths in India popularly known as Sample Registration System (SRS) in 1964-65 on a pilot basis and on full scale from 1969-70. The SRS since then has been providing data on a regular basis.

1.2 The demographic scenario in the Country has been undergoing a change since the inception of SRS; however, the profile and rate of change is not uniform across all the States/UTs. Overall, the Crude Birth Rate in the Country has come down from 36.9 per thousand population in 1971 to 18.3 in 2024, whereas the Crude Death Rate has declined from 14.9 to a low of 6.4 during the year 2024. The Infant Mortality Rate, which is an important indicator of the health status of the Country, has registered a significant decline from 129 per thousand live births in 1971 to 24 in 2024. During the period, the Total Fertility Rate of the Country has declined from 5.2 to 1.9. To fulfil its objective of monitoring the changes in vital indicators, the SRS sampling units are retained for about ten years, making it a panel household survey.

1.3 Various methods based on the application of sampling techniques have been tried and tested in many developing countries. Such methods include single and multi-round retrospective surveys and the dual record system. The SRS in India is based on a dual record system. The field investigation under Sample Registration System consists of continuous enumeration of births and deaths in a sample of villages/urban blocks by a resident part-time enumerator, and an independent six-monthly retrospective survey by a full-time supervisor. The data obtained through these two sources are matched. The unmatched and partially matched events are re-verified in the field to get a deduplicated count of events. The advantage of this procedure, in addition to the elimination of errors of duplication, is that it leads to a quantitative assessment of the sources of distortion in the two sets of records making it a self-evaluating technique.

1.4 The revision of SRS sampling frame is undertaken every ten years based on the results of the latest census. While changing the sample, modifications in the sampling design; wider representation of population; overcoming the limitations in the existing scheme; meeting the additional requirements etc. are considered. The first replacement was carried out in 1977-78 and the last being in 2014. Whereas the replacement of samples in earlier years was undertaken in phases spread over 2-3 years, the replacements in 2004 and 2014 were done in one go within a year. The following table provides the sample size in different replacement period.

Statement 1

Number of sample units at different replacement periods

Residence	1969-70	1977-78	1983-85	1993-95	2004	2014
Rural	2432	3684	4176	4436	4433	4961
Urban	1290	1738	1846	2235	3164	3892
Total	3722	5422	6022	6671	7597	8853

1.5 The earlier sample was based on the reliability of birth rate at the State level, whereas the 2004 and 2014 samples have been estimated using IMR reliability at natural division level. The present report 'SRS Statistical Report, 2024' is based on the sample from Census 2011 frame.

1.6 The main objective of SRS is to provide reliable estimates of Birth Rate, Death Rate and Infant Mortality Rate at the Natural division level for bigger States/UTs and at the State level for smaller States/UTs. Natural divisions are National Sample Survey (NSS) classified group of contiguous administrative districts with distinct geographical and other natural characteristics. It also provides data for other measures of fertility and mortality including Total Fertility, Infant and Child Mortality Rate at higher geographical levels.

Structure of the Sample Registration System

1.7 The main components of SRS are:

(i) Base-line survey of the sample units to obtain demographic details of the usual resident population of the sample areas;

(ii) Continuous (longitudinal) enumeration of vital events pertaining to usual resident population by the enumerator;

(iii) Independent retrospective half-yearly surveys for recording births and deaths which occurred during the half-year under reference and up-dating the House-list, Household schedule and the list of women in the reproductive age group along with their pregnancy status by the Supervisor;

(iv) Matching of events recorded during continuous enumeration and those listed in course of half- yearly survey;

(v) Field verification of unmatched and partially matched events; and

(vi) Filling of Verbal Autopsy Forms for finalized deaths.

Baseline Survey:

1.8 The baseline survey is carried out prior to the start of continuous enumeration. This involves preparation of a notional map of the area to be surveyed, house numbering and house listing and filling of a household schedule. The supervisor prepares a notional map with the help of the enumerator showing important landmarks and location of the houses to be covered in the sample unit. Subsequently, a list of houses/households to be covered by the sample in the House List (Form-1) is prepared and the Household Schedule (Form-2) is filled in. In the Household Schedule (Form-2), the residential status and other demographic particulars of each individual residing in the household viz. identification code, name, sex, date of birth, age, educational/marital status and relation to head of household, etc. are recorded. The inmates of public institutions like hotels, inns, schools and hospitals are excluded, but households living permanently within the compound of such institutions are covered. A list of all women in the reproductive span along with their pregnancy status is also prepared in Form 3 at the time of the baseline survey.

Continuous enumeration:

1.9 The enumerator maintains a Birth Record (Form 4 and 6) and a Death Record (Form 5 and 7) in respect of his/her area. The enumerator is expected to record all births and deaths occurring within the sample unit, as well as those of the usual residents occurring outside the sample unit. The events in respect of visitors occurring within the sample unit are also listed, but these are not considered while calculating rates. Thus, the events to be netted by the enumerator are those pertaining to: (i) usual residents inside the sample unit; (ii) usual residents outside the sample unit; (iii) in-migrants present; (iv) in-migrants absent; and (v) visitors inside the sample unit.

1.10 For ensuring complete netting, the enumerator uses different sources to get information of the occurrence of vital events in the sample unit. These include the help of the village priest, barber, village headman, midwife and such other functionaries. The enumerators maintain contact with these informants at frequent intervals and collects information about the occurrence of births and deaths. On being informed about the occurrence of an event, the enumerator visits the concerned household and records the prescribed particulars. The enumerator also keeps in touch with other socially important persons and visits local or nearby hospitals, nursing homes, cremation or burial grounds, at frequent intervals to keep updated about the occurrence of events. Despite all these efforts, the enumerator may miss information about some of the events and is, therefore, required to visit all the households once a month in sample villages/enumeration blocks so as to ensure that all the events have been recorded.

Half-yearly Survey:

1.11 Half-yearly survey is carried out independently in each sample unit by a full-time supervisor. The supervisor belonging to the statistical cadre of the State Census Directorates (either a Compiler or a Sr. Compiler or a Statistical Investigator or any suitable official) visits each and every household in the sample unit and records the particulars of births and deaths in Forms 9 & 10 respectively in respect of all the usual residents and visitors (only those occurring within the sample unit) which had occurred during the half-yearly period (January-June or July-December) under reference. Simultaneously, the house-list, the household schedule and the pregnancy status of women are updated by making entries of changes, if any. The list of all women in the reproductive span along

with their pregnancy status, which helps in better netting of all the births is available through mobile app to enumerator, so that better netting of event could be possible. While carrying out this survey the supervisor does not have access to the birth and death records of the enumerator for the same. The Half Yearly Surveys are retrospective in nature and therefore the first HYS for the reference period January-June of a year takes place in July- November period of that year and the Second HYS pertaining to July-December of a year takes place in January-May of the subsequent Year.

Matching:

1.12 On completion of the half-yearly survey, the events captured in the Forms 9 & 10 (filled-in by the supervisors) are compared with those in the Forms 4 & 5 (filled-in by the enumerators). This is done through online portal specially developed for SRS at the Office of Directorate of Census Operations for all States/UTs except for rural areas of Kerala, where it is done at the Directorate of Economics and Statistics of the States. Selected important entries in the enumerator's and supervisor's record are matched item by item and events are classified as fully matched, partially matched and unmatched. The items generally considered for matching for birth events are: Identification code of the head of Household and mother, Relationship of the mother to head, date of live birth, month in case of still-birth/abortion, sex in case of live birth /still-birth and the items considered for death events are: identification code of the head of household and mother in infant death, relationship of the deceased to head, date of death and sex of the deceased.

Field verification of unmatched and partially matched events:

1.13 Every unmatched or partially matched event is verified by a visit to the concerned household. This is done either by a third person or jointly by the supervisor and the enumerator, depending upon the availability of staff.

Sample Design:

1.14 The Sample design adopted for SRS is a uni-stage stratified simple random sample without replacement except in stratum II (larger villages) of rural areas, where two-stage stratification has been applied. In rural areas of bigger States/UTs (population with ten million or more as per Census 2011), the NSS natural division is the first level of geographical stratification. The overall stratification in rural areas has been done on size of villages with villages having population less than 2,000 forming Stratum I and villages with population 2,000 or more forming Stratum II. Smaller villages with population less than 200 were excluded from the sampling frame in such a manner that the total population of villages so excluded did not exceed 2 percent of the total population of the State. The number of sample villages in each State was allocated to the substrata proportionally to their size (population). The villages within each size stratum were ordered by the female literacy rate based on the Census 2011 data, and three equal-size substrata were established. The sample villages within each substratum were selected at random with equal probability. In the case of villages of Stratum II, each sample village with a population of 2,000 or more was subdivided into two or more segments in a way that none of the segments cut across the Census Enumeration Blocks (CEBs) and the population of each segment formed by grouping the contiguous CEBs was approximately equal and did not exceed 2000. A frame of segments was then prepared and the selection of segments was done at random at the second sampling stage for the SRS enumeration.

1.15 In urban areas, the categories of towns/cities have been divided into four strata based on the size classes in contrast to the six strata in the earlier sampling frame. Towns with population less than one lakh have been placed under stratum I, towns/cities with population one lakh or more but less than 5 lakhs under stratum II, towns/cities with population 5 lakh or more under stratum III and four metro cities of Delhi, Mumbai, Chennai and Kolkata as separate strata viz. stratum IV. The sampling unit in urban area is a Census Enumeration Block. The Census Enumeration Blocks within each size stratum were ordered by the female literacy rate based on the Census 2011 data, and three equal-size sub-strata were established. The sample Census Enumeration Block within each substratum was selected at random with equal probability. A simple random sample of these enumeration blocks has been selected within each sub-stratum without replacement from each of the size classes of towns/cities in each State/Union Territory.

Sample Size:

1.16 The Infant Mortality is the decisive indicator for estimation of sample size. The permissible level of error has been taken as within 15 prse (percentage relative standard error) at Natural Division level in respect of bigger States/UTs having population more than 10 million as per Census 2011. For minor States/UTs, 15 prse has been fixed at the total State level. By and large the above criteria have been followed. However, there have been a few exceptions on account of operational constraints. Half Yearly Survey 2024 was conducted in 8804 sample units, covering about 8.9 million sample population.

Statement 2

Number of sample units and population covered India, States and Union Territories, 2024

India/States/Union Territories	Number of Sample Units				Population Covered (in '000)		
	Total	Rural	Urban		Total	Rural	Urban
India*	**8839**	**4960**	**3879**		**8981**	**6418**	**2563**
Bigger States/Union Territories							
1. Andhra Pradesh	325	198	127		365	279	86

5. Lakshadweep	14	2	12		15	4	11
6. Puducherry	55	18	37		53	30	23

Note: 'Total' population may not add up to 'Rural' and 'Urban' population due to rounding.

*All the estimates presented for the State of Manipur are based on 130 SRS Units.

Estimation Procedure

1.17 For major States/UTs, estimates of population, births, deaths and infant deaths are generated for rural/urban areas separately at the natural division level. For smaller States/UTs, these estimates are generated for rural/urban areas separately at the State/UT level. The estimates of Birth, Death and Infant Mortality Rates are obtained as the ratios of the 'estimated births to estimated population', 'estimated deaths to estimated population' and 'estimated infant deaths to estimated births' respectively expressed in terms of per thousand.

Organization

1.18 From 1995, the SRS is being implemented mainly through the Directorates of Census Operations in both rural and urban areas. However, in the State of Kerala the implementation of field work and their monitoring for rural units has been entrusted to the Directorate of Economics & Statistics of the State Government and the urban units to the Directorate of Census Operations. Till 2020, the implementation of fieldwork in rural area of Maharashtra was also looked after by the Directorate of Economics and Statistics of State Government of Maharashtra.

1.19 For continuous enumeration, there is a resident part-time enumerator for each of the sample unit, who is usually an Anganwadi/ASHA worker/Teacher and is paid honorarium for this work. The independent retrospective half-yearly surveys are carried out by the full-time supervisors who are the regular staff of the State Directorate of Census Operations. One supervisor is usually assigned a set of 10 to 12 sample units for conducting half-yearly surveys. Each State headquarters through its staff manages; planning and organizing field operations, imparting training to the field staff, supervision and control, ensuring a regular flow of data from the field,

1.20 At the National level, the Vital Statistics Division of the Office of the Registrar General of India coordinates the implementation work, formulates and prescribes necessary standards, provides necessary instructions and guidance, undertakes tabulation, analysis and dissemination of data.

Training and Supervision

1.21 Before the commencement of work, requisite training is imparted to the enumerators to make them understand their role and responsibility. This is followed by trainings at periodic intervals to clarify the doubts and also to keep the enumerators updated with the improvements introduced in the system from time to time. Besides, they are also provided with a manual of instructions for day-to-day consultation to remove the difficulties in course of work. Supervisors are also given necessary training with a view to enable them to carry out the half-yearly surveys efficiently. They are also provided with a manual of instructions named "Instruction cum operating Manual" for this purpose. In addition to these, State officials associated with the implementation of the SRS are also given necessary training. The detailed instructions and guidance, with regard to the various stages of work, have been explained in the Instruction cum operating Manual.

1.22 Supervision of the field work is an important component of SRS and is undertaken by the supervisory level officials such as the Investigator, Assistant Director, Deputy Director, Joint Director and Director. Officers at the State headquarters also undertake visits to sample units and inspect the work at the field level. Officers of Vital Statistics Division in the headquarters also undertake surprise checks and visits in SRS units to control the quality of work.

Data collection

1.23 In the baseline survey, which is conducted jointly by both the enumerator and the supervisor, the data is being collected in Forms 1, 2 and 3 and Form 0 is also filled at the end of survey in a unit. The baseline survey is a decennial exercise which takes place after availability of new frame through latest census. The data collection in the field is carried out by the enumerators for continuous enumeration and supervisors for retrospective survey. Half Yearly Survey is conducted by the full-time supervisor. In Half Yearly Survey, besides updating the Forms 1, 2 and 3, the details of births and deaths occurred in the sample units in the reference period are also collected in Forms 9 and 10 respectively.

Introduction of Automation in SRS

1.24 The quality of data collection is of paramount importance in any survey especially in Sample Registration System considering its focus on data of births, deaths, infant deaths, details of pregnancy, etc. which are to be collected with utmost care. Towards fulfilling this objective, dual record system has been in practice in SRS apart from other quality measures in the field. To take the credibility and efficiency of the field survey to greatest heights, it was the endeavor of the Office of the Registrar General of India, to implement full automation in Sample Registration System. Accordingly, from Baseline 2014 onwards the entire process of data collection and processing has been automated. This pioneering step of a paper-less survey, for the first time in the history of SRS, can be viewed as greatly contributed to the recent Digital India initiatives of the Government of India.

1.25 In the automated procedure, the supervisor and enumerators are now carrying a mobile app to the sample units and the data is collected directly on the android-based apps saving time and cost of the survey with efficiency. Dedicated apps for all 4 modules of the Sample Registration System and portal have been developed for this purpose by the Office of Registrar General of India and user-based access has been given to the different users. The Directorate of Census Operation monitors the operation of fieldwork through a portal including activities like allocation of units to different users, matching of the data and finalization of the collected data under the survey. This has made the system paperless as there is no need to send finalized results in paper format by any user.

1.26 These apps enable survey supervisors and enumerators to directly collect and upload data on the SRS portal without any manual intervention. The app is developed for all 4 modules of the Sample Registration System and PTE module is also available in local languages for data collection by Part-Time Enumerators.

SRS Forms and their flow

1.27 For collecting information on population and vital events, various forms/ schedules have been prescribed under the SRS. Depending upon various operations under the system, the following 17 types of forms are used under SRS:

A. Baseline Survey Forms

Form 1: House List

Form 2: Household Schedule

Form 3: Pregnancy Status of Women

B. Continuous Enumeration Forms

Form 4: Outcome of Pregnancy recorded by Enumerator (January-June/July-December)

Form 5: Deaths recorded by Enumerator (January-June/July-December)

Form 6: Monthly report of Outcome of Pregnancy

Form 7: Monthly report of Deaths

C. Half-yearly Survey Forms

Form 9: Outcome of Pregnancy recorded by Supervisor (January-June/July-December)

Form 10: Deaths recorded by Supervisor (January-June/July-December)

Form 15: Distribution of usual resident population by age, sex and marital status (as on 1st July/1st January)

Form 16: Distribution of Female population by broad age groups and levels of education (as on 1st July/1st January)

Form 17: Number of females who got married by age at effective marriage (January-June/July-December)

D. Compilation/Tabulation Forms

Form 8: Consolidated monthly report on births and deaths

Form 11: Finalized list of Outcome of Pregnancy (January-June/July-December)

Form 12: Finalized list of Deaths (January-June/July-December)

Form 13: Results of the HYS for Outcome of Pregnancy (January-June/July-December)

Form 14: Results of the HYS for Deaths (January-June/July-December)

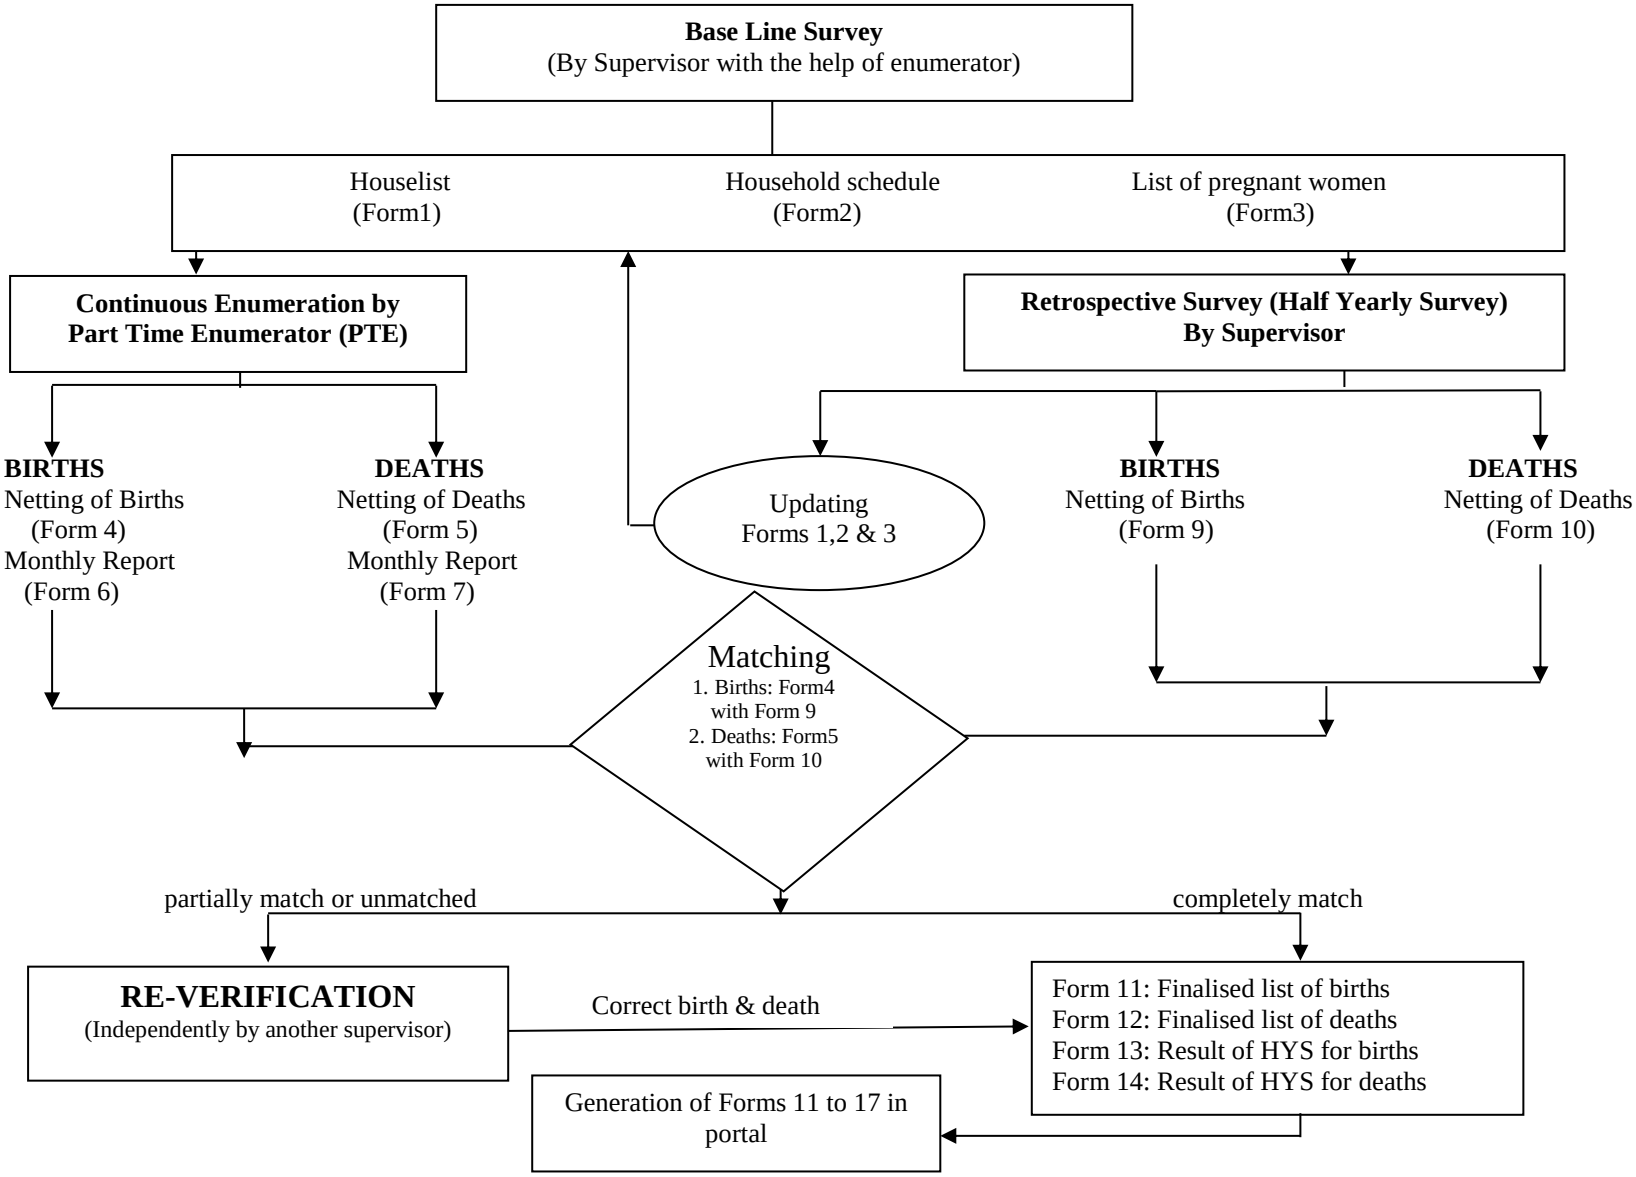

1.28 The enumerator records the details of each birth and death event that occurred during the reference period in Forms 4 and 5 respectively on a continuous basis. A monthly report on births and deaths (Forms 6 and 7) is required to be uploaded by the enumerators on the app in the first week of the following month. The relevant entries of birth and death records in the monthly report are auto-populated in six monthly records and uploaded on the portal. Enumerator can add any

missed events in six monthly reports as per Form 4 and 5 and upload them on the portal missed in any of the monthly reports.

1.29 The supervisor records the details of each birth and death event occurring during the six-month reference period in Forms 9 and 10 respectively in addition to the updation of Forms 1, 2 and 3. After matching of each birth and death event recorded in Form 4 and 5 with those in Form 9 and 10 and verification of partially and unmatched events in the field, finalized Form 11 and 12 are prepared after necessary corrections and inclusion of additional events recorded during the re-verification. These forms i.e. Form 11 and Form 12 are auto-generated in the portal along with the half-yearly survey results in Form 13, 14, 15, 16 and 17 after the finalization of the data on the portal. The complete processes automization i.e. aggregation of birth and death events reported by PTEs as well as HYS Supervisors, matching, re-verification and generation of report 11 to 17; reduces time required for data collection and data processing; thereby leading to improvement in quality of data.

1.30 Flow-chart of SRS returns are shown in Chart 1. Due to automation most of the errors in terms of wrong classification of sex or invalid coding, not legible details are taken care of. We do not get birth and death without sex classification or without essential details as the application does not allow for such omission /commission.

CHAPTER 2

POPULATION COMPOSITION

Data on population distribution by age and sex serves as a predominant resource for a wide range of users, including demographers, public health officials and development planners. This information is essential for the formulation, implementation and evaluation of various health and development programs. The classification of the population by residence, sex, marital status and age provides valuable insights into the demographic structure and characteristics of the population. Such disaggregated data allows for a more nuanced understanding of population composition and supports evidence-based decision-making. Given the centrality of age as a key demographic variable, data on age is systematically collected and updated in each of the Half-Yearly Surveys of the Sample Registration System (SRS).

2.2 As per available data from SRS, there has been a gradual decline in the share of population in the age group 0-14 from 41.2 to 38.1 percent during 1971 to 1981 and 36.3 to 24.0 percent during 1991 to 2024, whereas the proportion of the economically active population (15-59 years) has increased from 53.4 to 56.3 percent during 1971 to 1981 and 57.7 to 66.4 percent during 1991 to 2024 .The proportion of the elderly population remains same for those aged 65 and over and for those aged 60 and over, reaching 6.4% and 9.7% respectively over the previous year. Marital status and Female mean age at marriage are essential constituents to monitor fertility and population growth. The data on marital status has been included in SRS from 1991, whereas on Female mean age at marriage from 1990 onwards. There is a marginal increase in the proportion of married Females from 45.7 in 1991 to 49.6 in 2024, whereas the proportion of widowed/divorced/ separated females has decreased from 8.1 in 1991 to 5.4 in 2024. The mean age at effective marriage for Females has increased from 19.3 years in 1990 to 23.1 years in 2024.

2.3 This chapter provides data on the percentage distribution of population by age, sex and residence for all broad age-groups from 0-4, 0-14, 15-59 and 60+ for India and bigger States/UTs for the year 2024. It also includes data on the percentage distribution of the population by marital status for total population, 10+ and 15+ ages by sex and residence. The State-wise variations in effective age at marriage for females and their corresponding proportions have also been presented in this chapter.

Age composition:

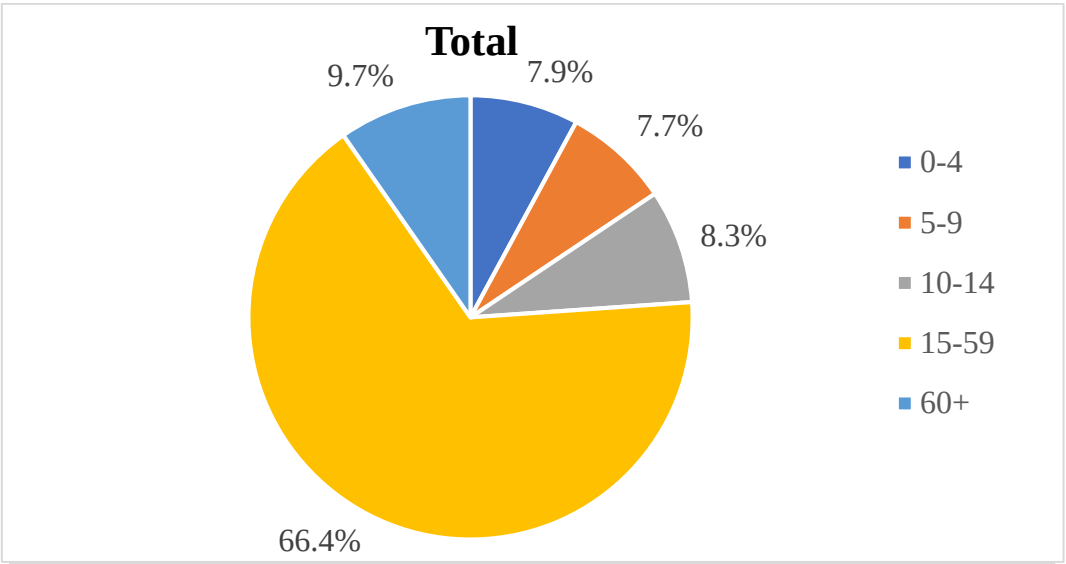

2.4 Age composition by residence and broad age-groups 0-14, 15-59, and 60+ for the year 2024 at the National level is shown below in Statement 3. The age-group 0-14 is further sub-categorized into the age-groups 0-4, 5-9 and 10-14. In the age-group 0-14, Male population is about 1.2 % more than Female, whereas in the older age-groups 15-59, 60+, and 15-64, the percentage of Females is more than that of Males by 0.4, 0.8, and 1.0 percentage points respectively. The proportion of young children in the age group 0-4 and also the proportion of the population in the age group 0-14 are higher in rural areas than in urban areas both for Males and Females. A higher proportion of Males and Females in the working age-group 15-59 live in urban areas as compared to rural areas. Chart 2 gives a pictorial presentation of data shown in Statement 3. The population pyramid of India is presented in Chart 3.

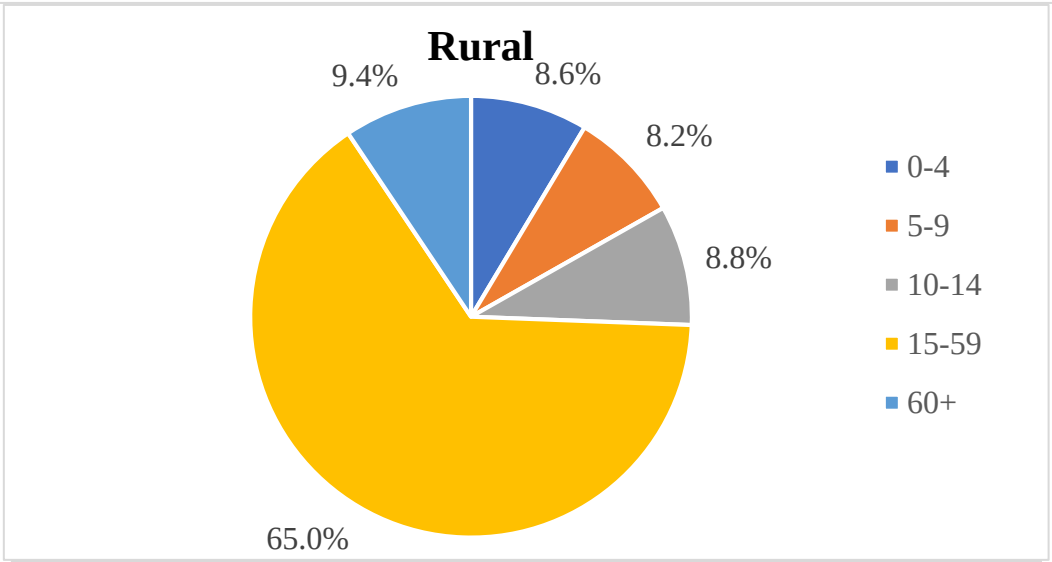

Statement 3
Percentage Distribution of the Population by broad Age-groups, Sex and Residence, India, 2024

Residence	Sex	Broad age-groups (years)							
		0-4	5-9	10-14	0-14	15-59	60+	15-64	65+
Total	Total	7.9	7.7	8.3	24.0	66.4	9.7	69.7	6.4
	Male	8.1	7.9	8.5	24.5	66.2	9.3	69.2	6.3
	Female	7.7	7.5	8.2	23.3	66.6	10.1	70.2	6.5
Rural	Total	8.6	8.2	8.8	25.6	65.0	9.4	68.1	6.3
	Male	8.8	8.4	9.0	26.2	64.8	9.0	67.6	6.2
	Female	8.3	8.0	8.6	24.9	65.1	9.9	68.6	6.5
Urban	Total	6.6	6.8	7.4	20.9	69.0	10.1	72.6	6.5
	Male	6.8	7.0	7.6	21.4	68.7	9.8	72.1	6.4
	Female	6.4	6.7	7.2	20.3	69.3	10.4	73.1	6.6

Note: Total percentage do not add to 100 on account of rounding in broad age-groups.

Chart 2: Percentage Distribution of the Population by broad Age-groups and Residence, India, 2024

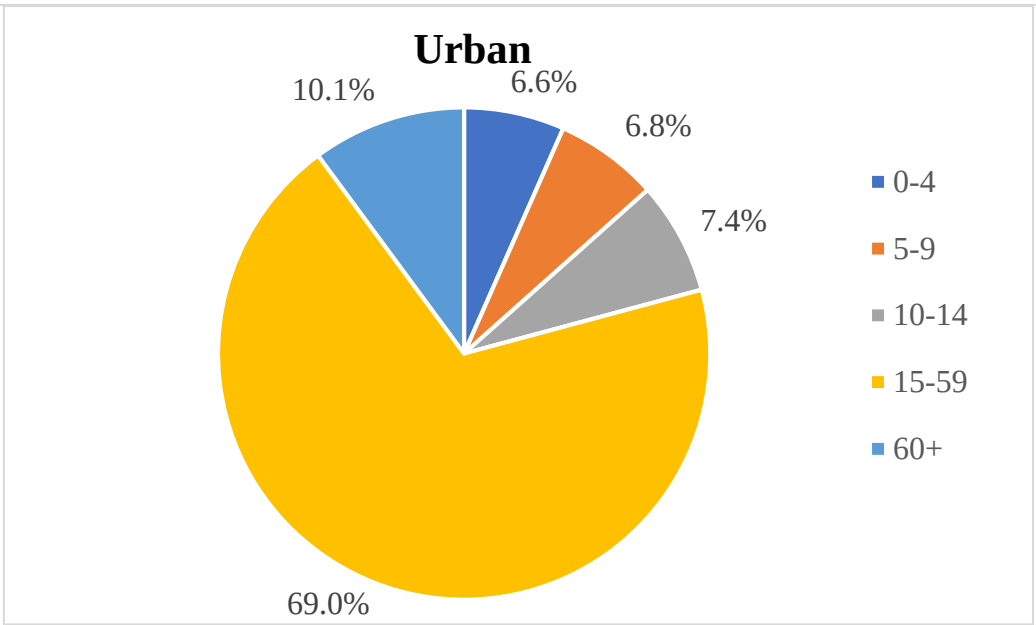

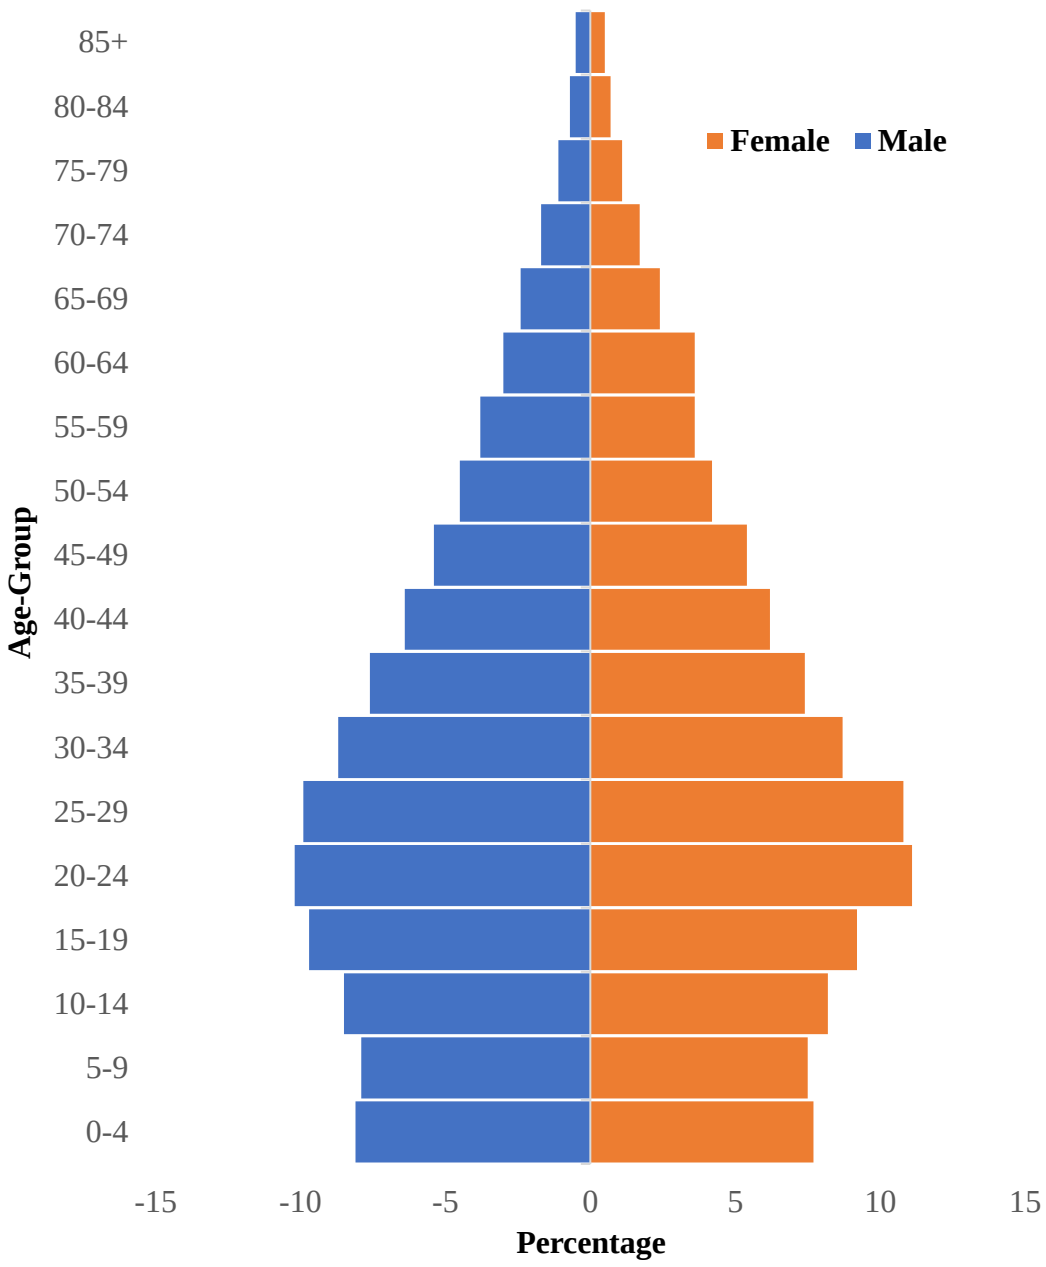

Chart 3: Population Pyramid, India, 2024

2.5 Percentage share of the population in the selected age-groups for bigger States/UTs by residence and sex for the year 2024 are given in Statements 4 to 7. Statement 4 gives State-wise percentage of the child population (below 5 years of age). In India, the percentage of the population in the age-group 0-4 years is 7.9%, with males and females being 8.1% and 7.7%, respectively. In rural areas, it is 8.6%, with males and females being 8.8% and 8.3%, respectively. In urban areas, it is 6.6%, with males and females being 6.8% and 6.4% respectively.

2.6 Among the bigger States/UTs, Bihar has the highest percentage of the population in the age group 0-4 years with 11.1%, followed by both Rajasthan and Madhya Pradesh at 9.4 %, and Chhattisgarh at 9.1%. The lowest percentage is in Tamil Nadu (5.7%) followed by Jammu & Kashmir and Punjab with 5.9 % and 6.0 % respectively. In rural areas also, Bihar has the highest percentage with 11.4% followed by Madhya Pradesh (10.0 %), Chhattisgarh, and Rajasthan each at 9.7%. The lowest percentage is in Tamil Nadu with 5.9%. In urban areas, Bihar has the highest percentage of the population in the age group 0-4 years with 9.0 %, followed by Rajasthan (8.6%). The lowest percentage is in Himachal Pradesh, and West Bengal with 5.1 %.

2.7 In terms of total population, it varies from 5.7% in Tamil Nadu to 11.1% in Bihar. The percentage of males in the 0-4 age group is slightly higher than females in all the States, except in Andhra Pradesh and Telangana for urban areas and in Delhi for rural areas. However, the difference is relatively small, with the largest gap observed in Bihar where the percentage of males is 1.5 percentage points higher than females. Chart 4 and 5 shows the percentage of child population for bigger States/UTs by residence and sex respectively.

Statement 4

Percentage of population in the Age-group 0-4 years by Sex and Residence, India and Bigger States/UTs, 2024

India and Bigger States/UTs	Total			Rural			Urban		
	Total	Males	Females	Total	Males	Females	Total	Males	Females

Chart 4: Percentage of Child Population (0-4 years) to Total Population by Residence, India and Bigger States/UTs, 2024

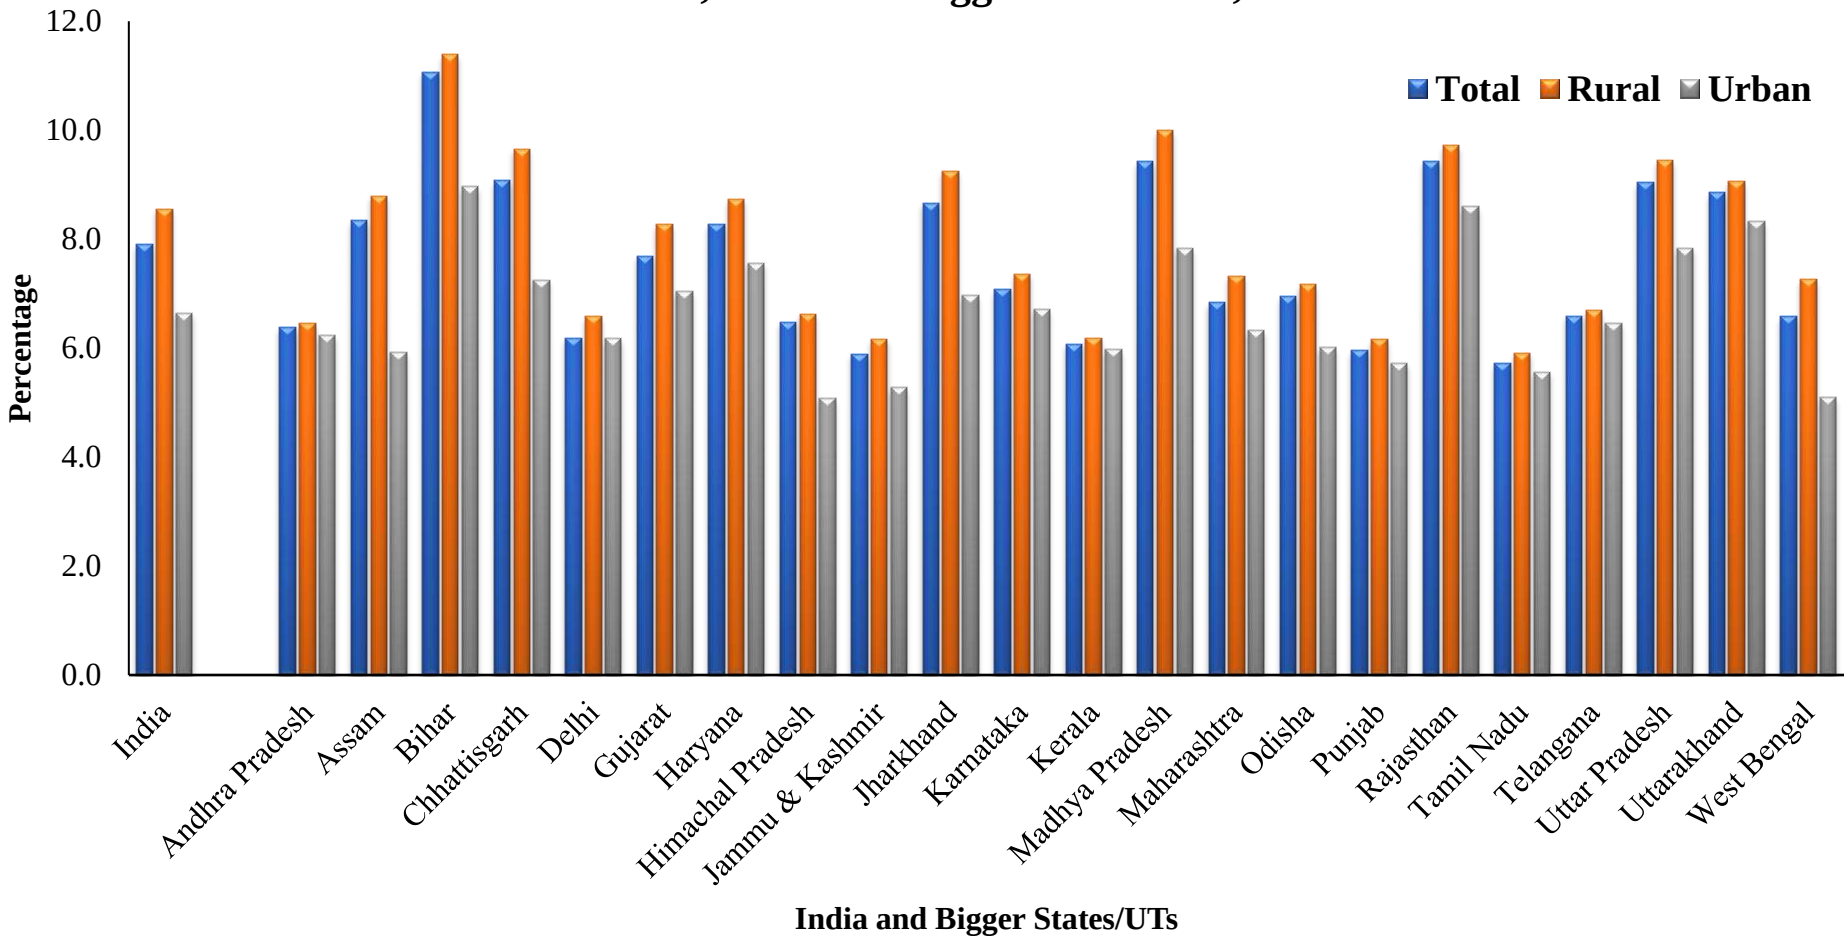

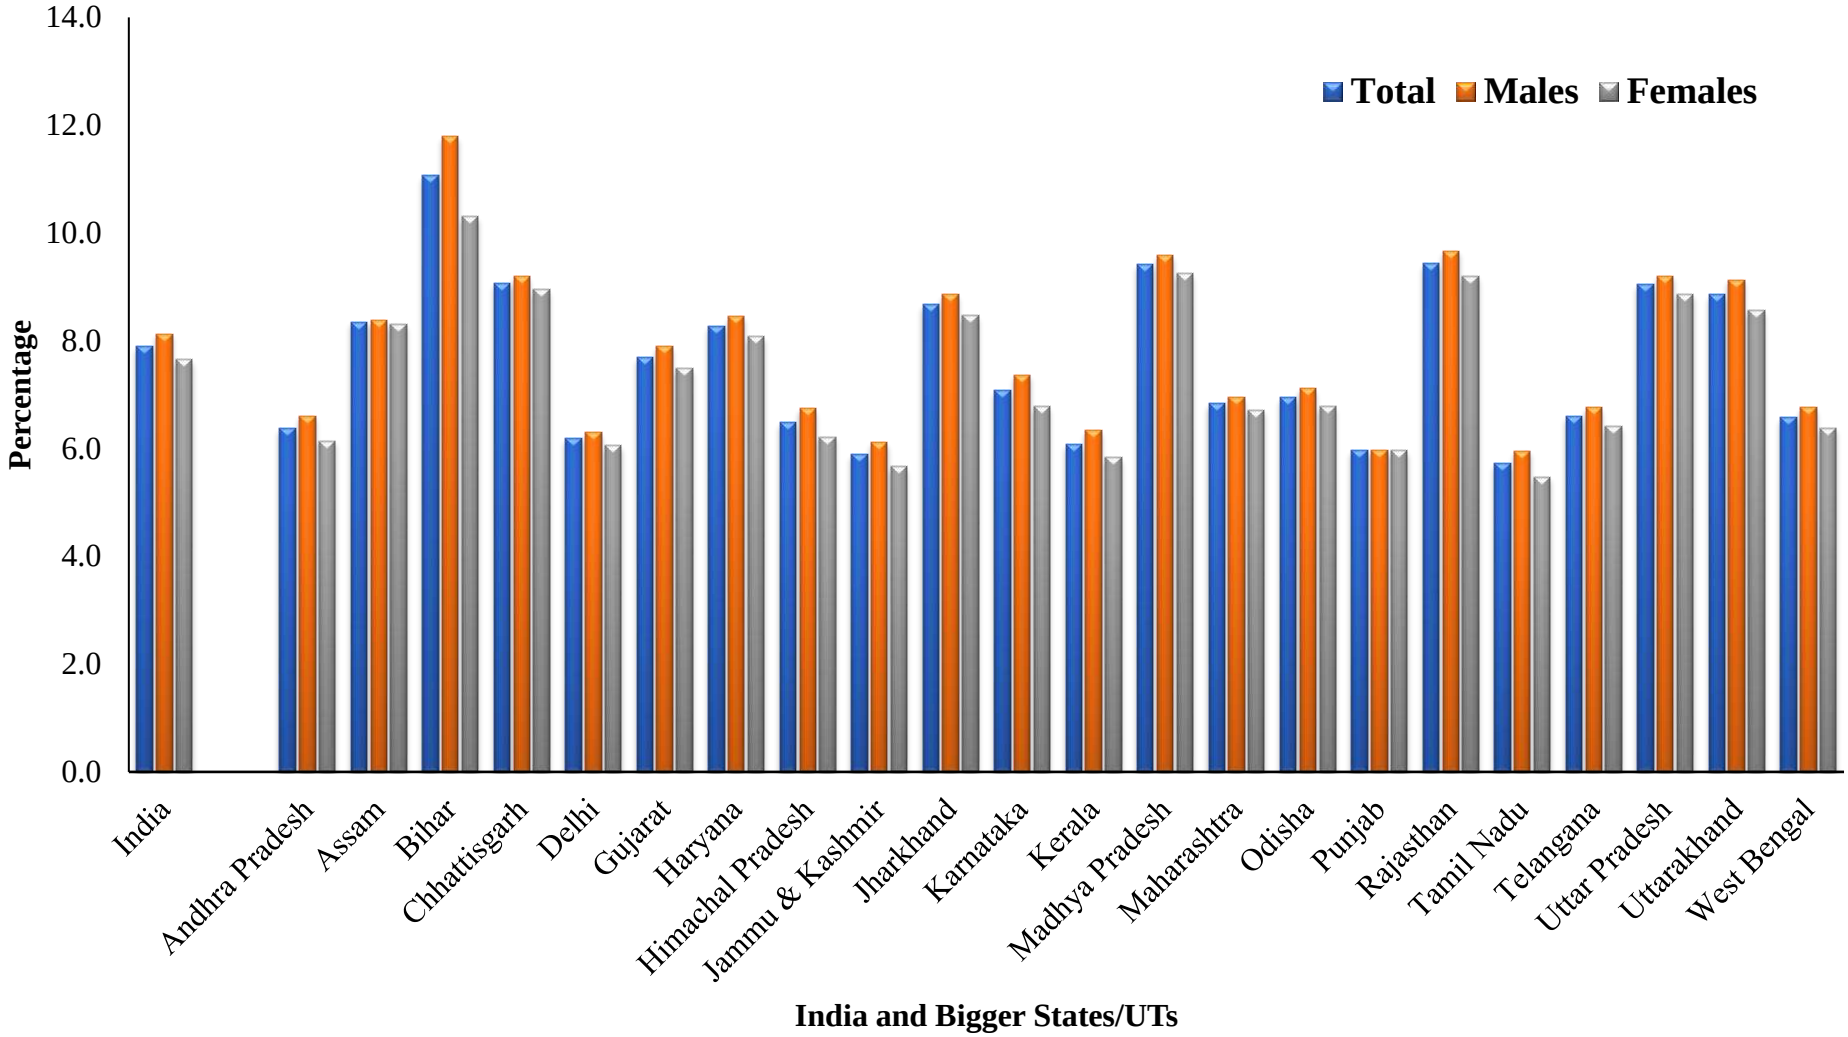

Chart 5: Percentage of Child Population (0-4 years) to Total Population by Sex, India and Bigger States/UTs, 2024

2.8 Statement 5 presents the percentage of the population aged below 15 years in India and bigger States/ UTs, disaggregated by sex and residence for the year 2024. At the National level, 24.0 % of the population falls within the 0–14 year's age-group. Within this cohort, males constitute 24.5% and females 23.3%. A rural-urban comparison reveals that 25.6% of the rural population is under 15 years of age, compared to 20.9% in urban areas. Among the bigger States/UTs, Bihar records the highest percentage of population in the 0–14 years age-group at 31.5%, followed by Madhya Pradesh at 27.4 % , Rajasthan, and Uttar Pradesh each at 27.3%. In contrast, States such as Tamil Nadu (18.0 %), Andhra Pradesh, Jammu & Kashmir (each at 19.0%), and Punjab (19.2%) report comparatively lower proportions of population in this age-group.

2.9 The data indicate that, across all States /UTs, the percentage of males in the 0-14 age group is higher than that of females, except in the rural areas of Delhi, where the proportion of females exceeds that of males. Additionally, the percentage of the population aged 0-14 years is generally higher in rural areas compared to urban areas across bigger States/UTs, except Telangana. Charts 6 and 7 provide a visual representation of the percentage of persons below 15 years of age by residence and sex, respectively, for the bigger States/UTs.

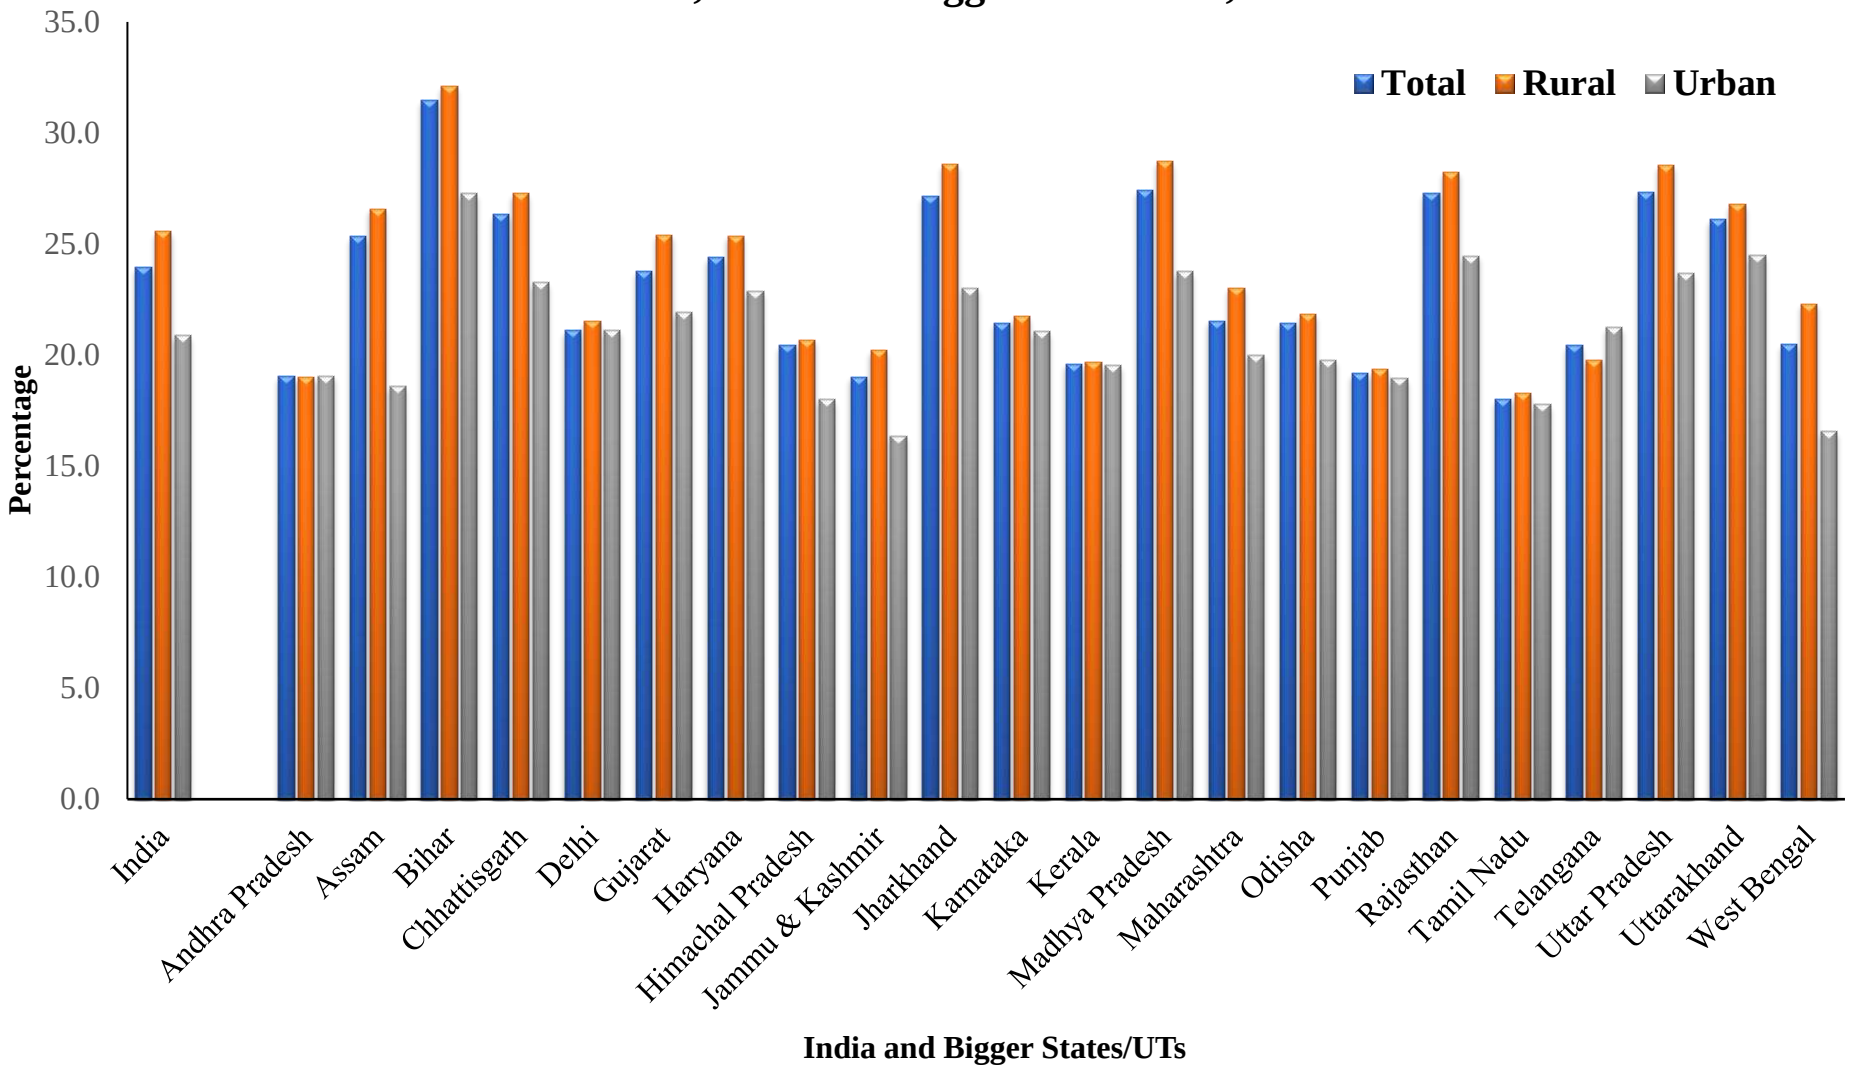

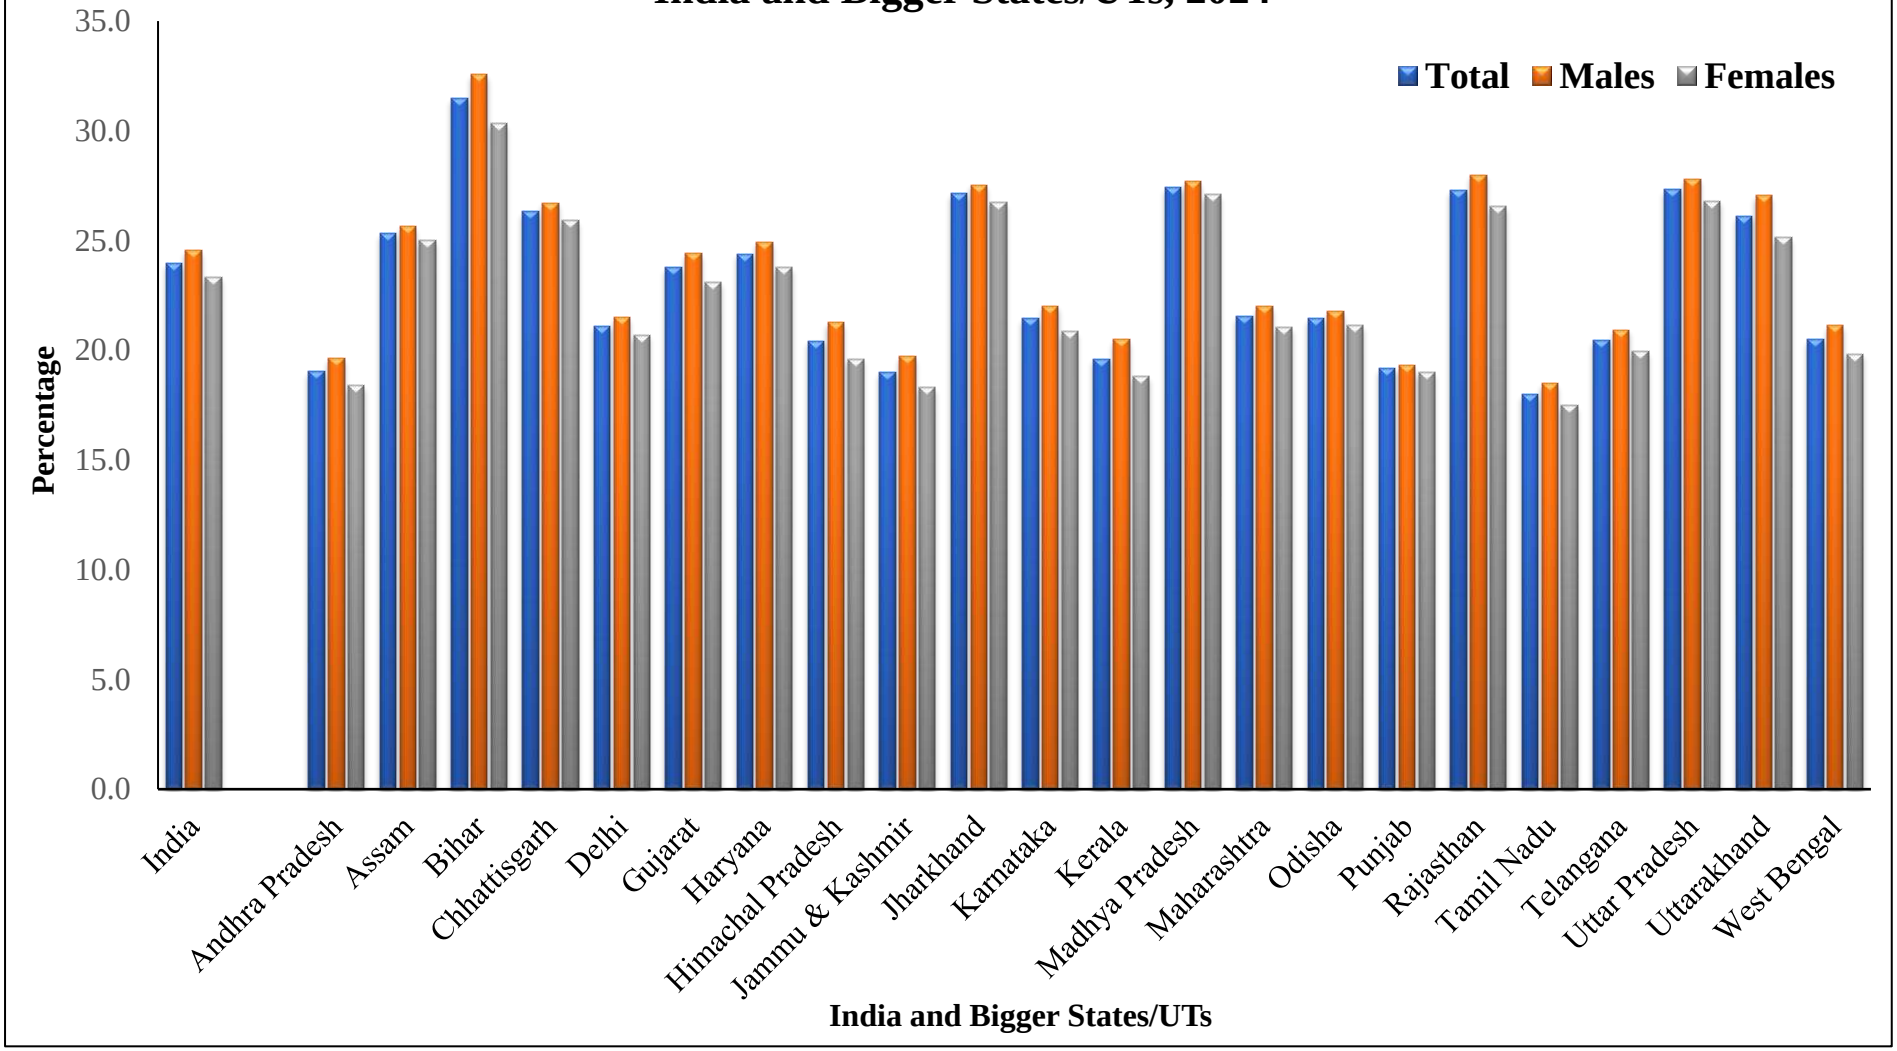

Chart 7: Percentage of Population aged 0-14 years to Total Population by Sex, India and Bigger States/UTs, 2024

2.10 Statement 6 provides information on the percentage of the population in the working age-group 15-59 years by sex and residence for India and bigger States/UTs in 2024. At the National level, the total percentage of the population in the age-group 15-59 years in India is 66.4%, with 66.2% for males and 66.6% for females. The rural areas have a slightly lower percentage of the population in this age-group 65.0% compared to urban areas 69.0 %. Among the States/UTs, Delhi has the highest percentage of the population in the age-group 15-59 years, with 71.1%, followed by Telangana (70.5%), and Andhra Pradesh (70.4%). Bihar has the lowest percentage of the population in this age group at 60.7%, followed by Rajasthan (63.7%), Madhya Pradesh (64.1), and Uttar Pradesh (64.2).

2.11 There are also variations in the percentage of males and females in this age-group across different States/UTs and between rural and urban areas. For instance, Jammu & Kashmir has the highest percentage of females in this age-group in rural areas at 70.1%, and also has the highest percentage of females in the age-group 15-59 years in urban areas at 72.8%. Delhi has the highest percentage of males in the age-group 15-59 years in rural areas at 72.4% while Telangana has the highest percentage of males in this age-group in urban areas at 71.3%. Chart 8 and 9 gives the pictorial presentation of percentage of population in the age-group 15-59 years for bigger States/UTs by Residence and Sex respectively.

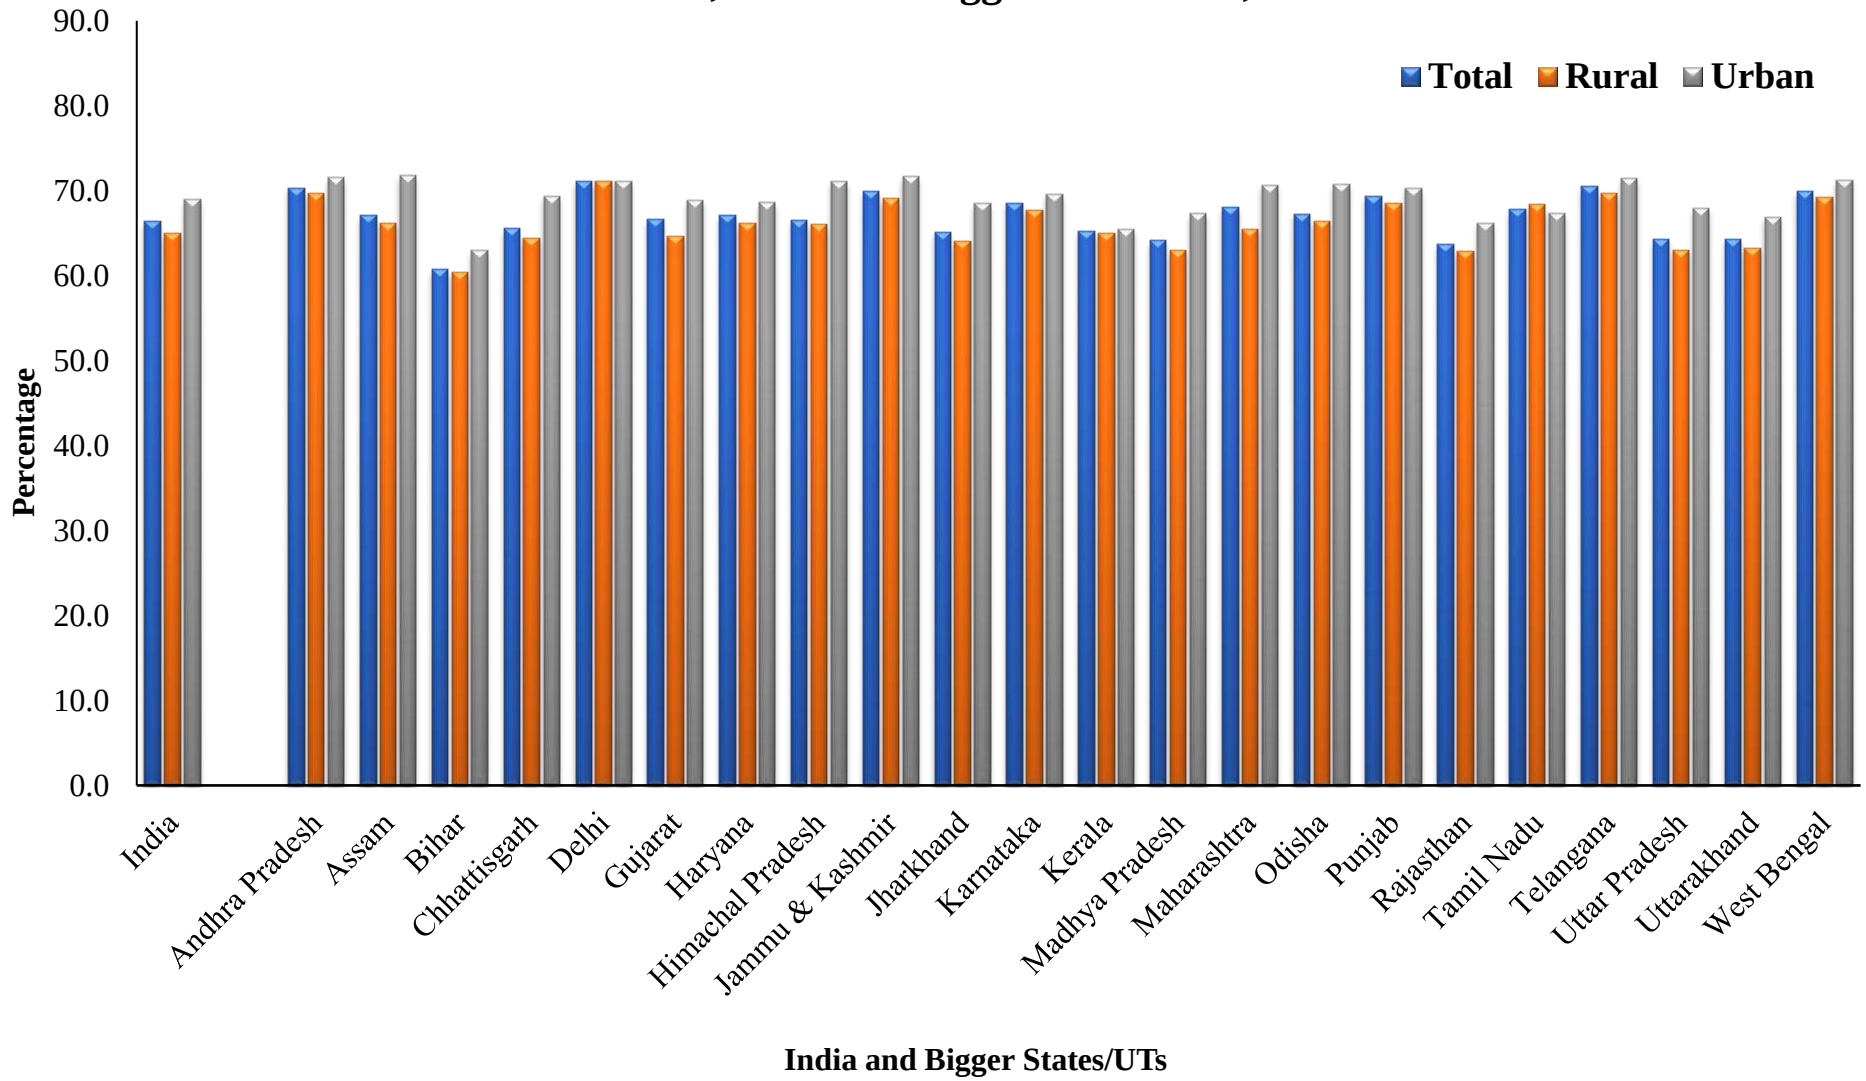

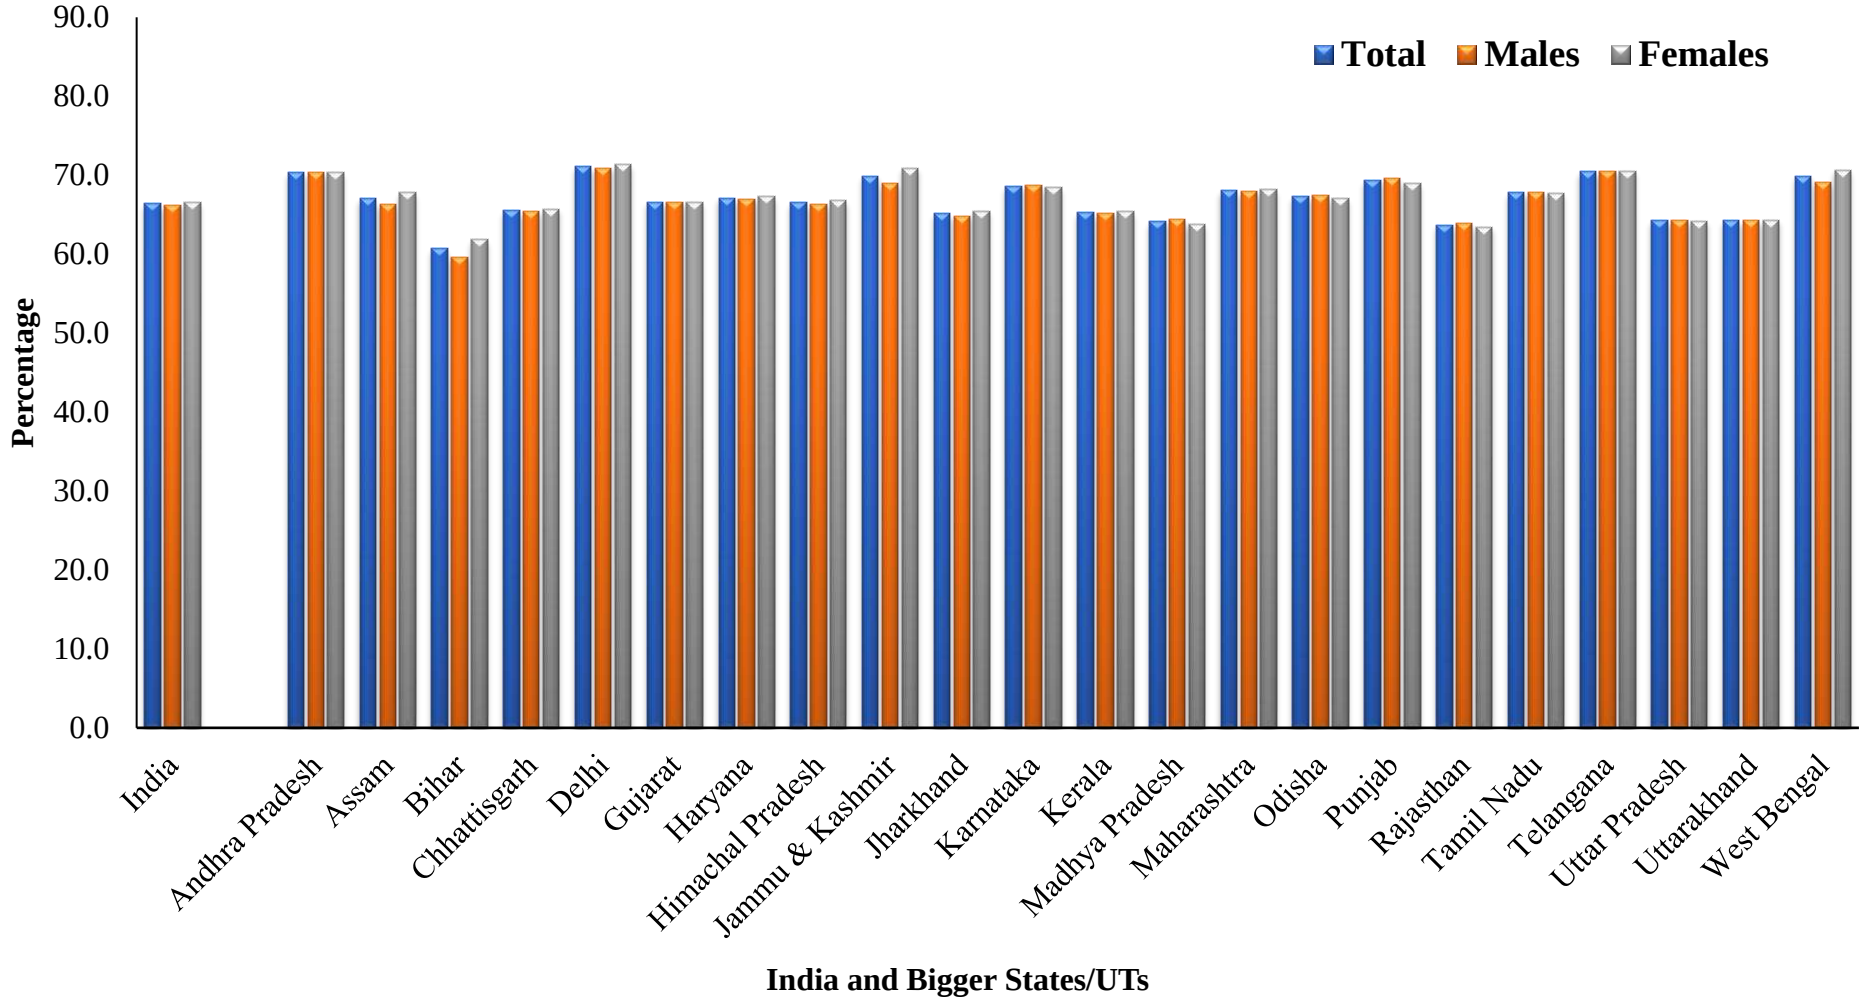

Chart 9: Percentage of Population aged 15-59 years to Total Population by Sex, India and Bigger States/UTs, 2024

2.12 Percentage of aged persons (60 years and above) for India and bigger States/UTs by Sex and Residence for the year 2024 is given below in Statement 7. At the National level, 9.7% of the total population is aged 60 years and above, with a slightly higher percentage for females 10.1% than males 9.3%. In rural areas, 9.4% of the population is aged 60 years and above, while in urban areas, the percentage is slightly higher at 10.1%. Overall, the percentage of the population aged 60 years and above varies across different States and UTs in India, with some having a much higher proportion of elderly citizens than others.

2.13 In the bigger States/UTs, the data reveals that Kerala has the highest percentage of population in the age group of 60 years and above with 15.1% of the total population falling under this category. Tamil Nadu (14.2 %) and Himachal Pradesh (13.0 %) are the next two States with the highest percentage of elderly population. On the other hand, Assam (7.6%), Jharkhand (7.7), Bihar (7.8%), and NCT of Delhi (7.8%) have the lowest percentage of the population in the age-group of 60 years and above.

2.14 The percentage of elderly females is either same or higher than elderly males in most States/UTs except for state of Assam, Jammu & Kashmir, and West Bengal. Percentage of elderly males is highest in Kerala with 14.4% followed by Tamil Nadu (13.6 %) and Himachal Pradesh (12.4%). It is lowest in Delhi and Jharkhand at 7.6% each, followed by Bihar, and Chhattisgarh at 7.8%. In case of females, percentage of elderly population is highest in Kerala (15.8%) followed by Tamil Nadu (14.8 %) and Himachal Pradesh (13.6%) and it is lowest in Assam (7.2%) followed by Bihar, and Jharkhand at 7.8%. In case of rural areas, the percentage of elderly population is highest in Kerala (15.3%) followed by Tamil Nadu (13.4%) and Himachal Pradesh (13.2%). It is lowest in Assam (7.2%) followed by and Delhi (7.3%), and Jharkhand (7.4%). In urban areas, the percentage of elderly population is highest in Kerala (15.0%) followed by Tamil Nadu (14.9 %) and West Bengal (12.2 %) and it is lowest in Telangana, and Chhattisgarh at 7.3%. The pictorial presentation of percentage of old age population by residence and sex for bigger States/UTs is given in Chart 10 and 11 respectively.

Marital Status

2.15 Besides age, the other important demographic characteristic collected and subsequently updated during each half-yearly survey of the SRS is marital status. Distribution of the population by marital status is thus available from SRS.

2.16 The statement 8 presents the percentage distribution of the population by marital status and sex for India and bigger States/UTs for the year 2024. The data is presented in three categories: Never married, Married and Widowed/Divorced/Separated (W/D/S). For India in 2024, 50.3% of the total population had never been married, with a higher percentage among males (55.4%) than females (45.0 %). On the other hand, 46.2 % of the total population was reported as married, with a higher percentage among females (49.6 %) than males (43.0 %). The remaining 3.5% of the population was either widowed, divorced or separated, with a higher percentage among females (5.4 %) than males (1.6 %).

2.17 Among the bigger States/UTs, the percentage distribution of the population by marital status and sex varied considerably in 2024. For instance, Bihar and Jammu & Kashmir has the highest percentage of the never married population at 58.0% and 57.9% respectively, while Tamil Nadu has the lowest percentage (40.9%). The highest percentage of the population was reported as widowed, divorced or separated in Tamil Nadu (7.2%) and lowest in Bihar (1.5%). The highest and lowest percentage of married population was reported in Tamil Nadu (51.9%) and Jammu & Kashmir (40.4%). Chart 12-14 represents the distribution of population according to marital status for Persons, Males, and Females respectively.

Note: Total may not add to 100 due to rounding off. W/D/S- Widowed/Divorced/Separated

Chart 12: Percentage Distribution of Population by Marital Status, India and Bigger States/UTs, 2024

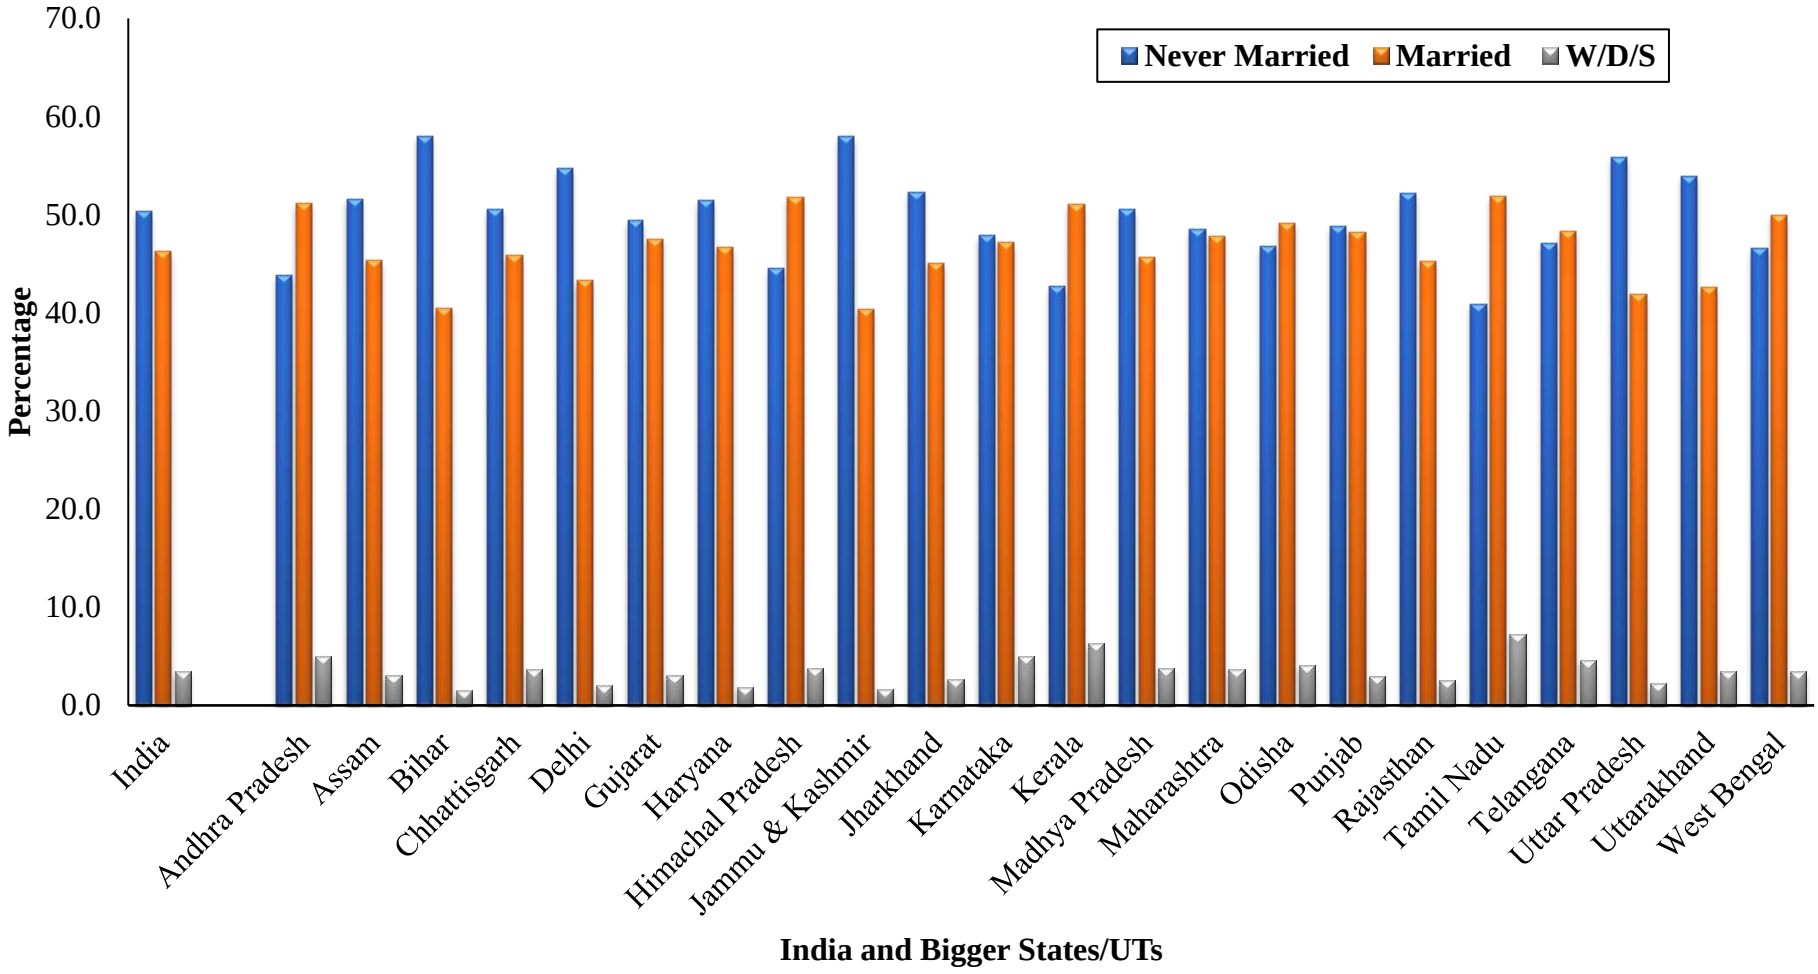

Chart 13: Percentage Distribution of Male-Population by Marital Status, India and Bigger States/UTs, 2024

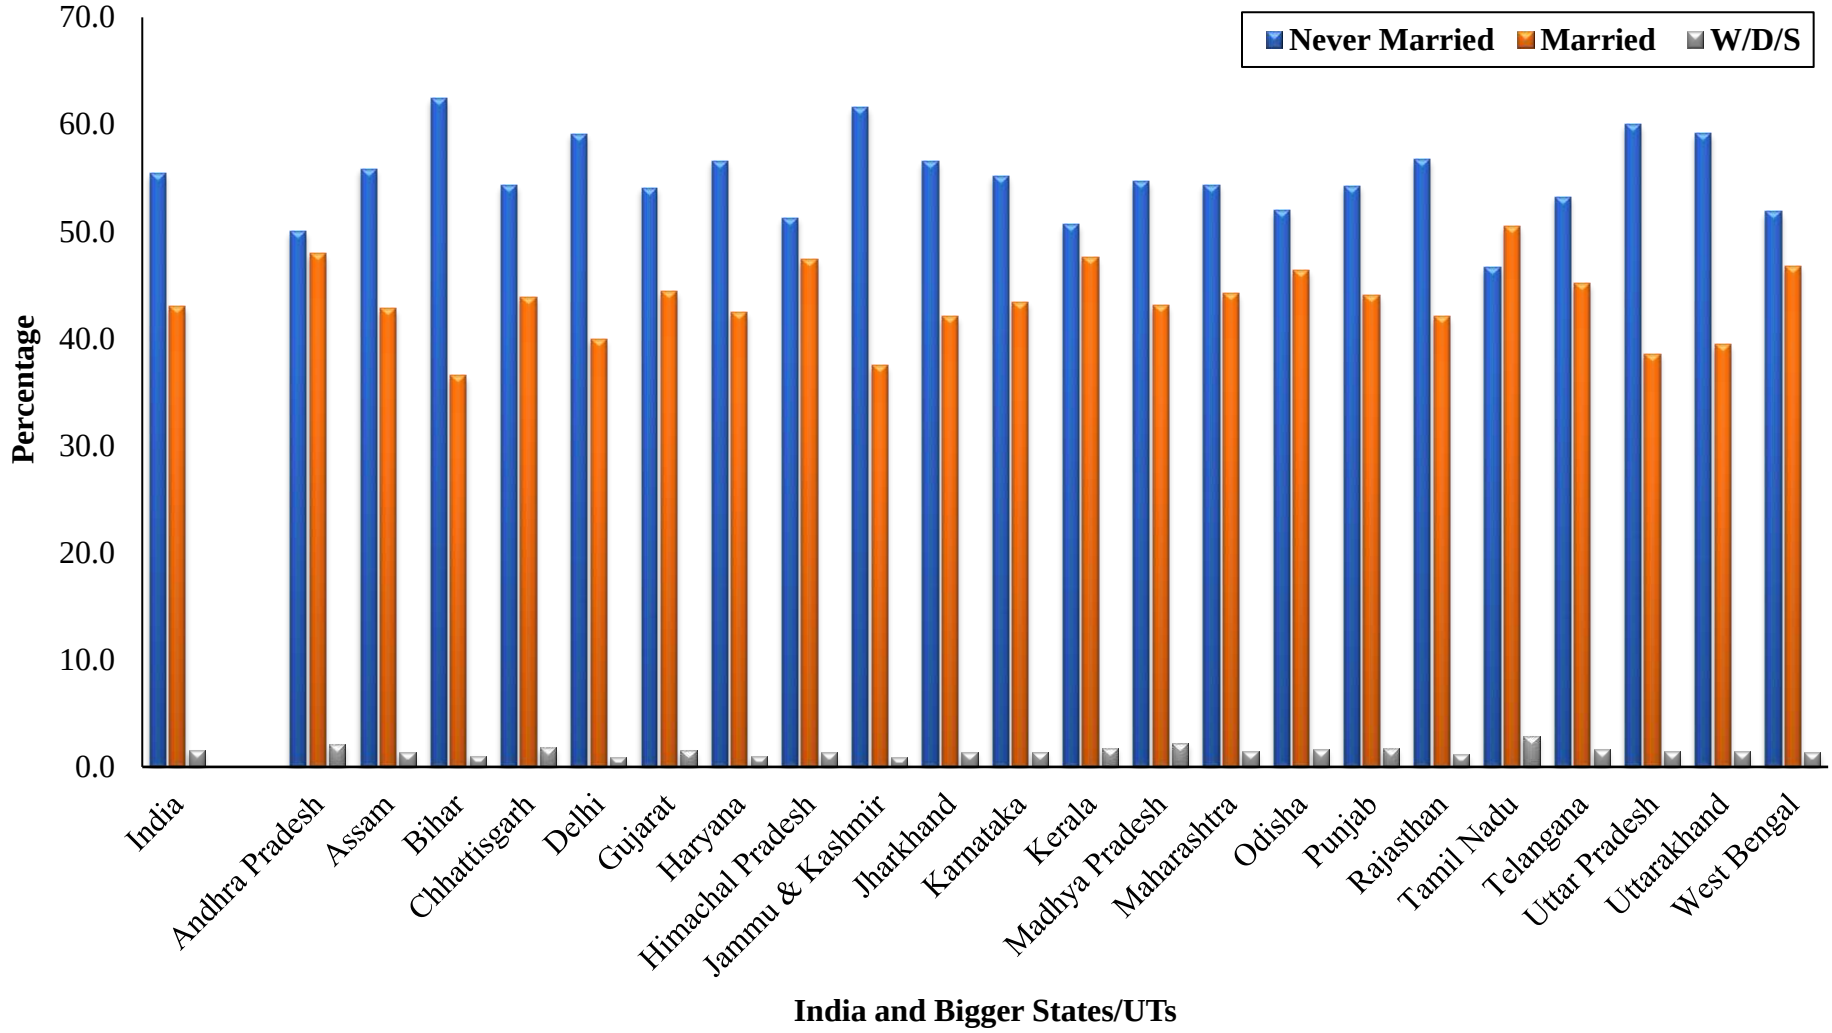

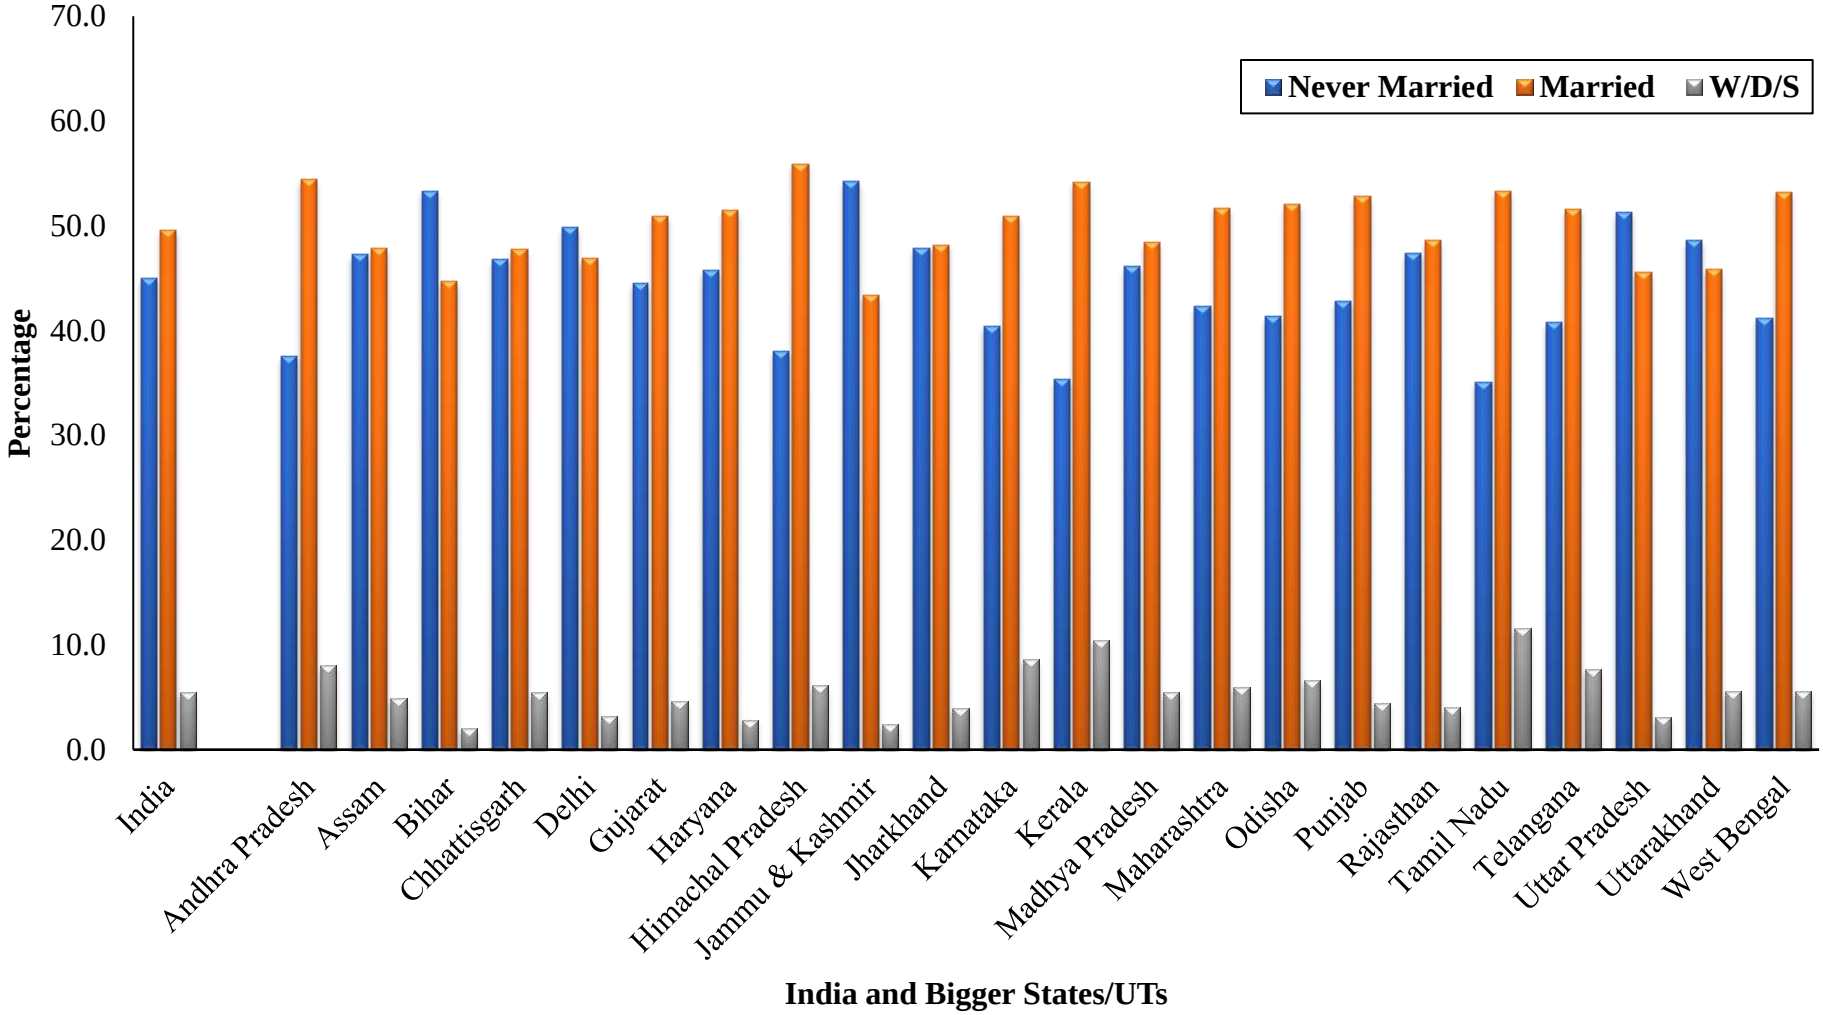

Chart 14: Percentage Distribution of Female-Population by Marital Status, India and Bigger States/UTs, 2024

2.18 Statement 9 given below provides percentage distribution of population for age 10 years and above by Marital Status and Sex for India and bigger States/UTs for the year 2024. The data is given in terms of percentage of individuals who are never married, married and widowed/divorced/separated, divided by sex. In 2024, for India, 41.1% of the population aged 10 and above were never married, while 54.8% were married, and 4.1% were widowed/divorced/separated. Among males, 46.9% were never married, while 51.2% were married and 1.8% were widowed/divorced/separated. Among females, 35.1% were never married, while 58.5 % were married and 6.4% were widowed/divorced/separated.

2.19 The data show some variation across the different States/UTs. For instance, the percentage of the population aged 10 and above who have never married is lowest in Tamil Nadu (33.2%) and highest in Jammu & Kashmir (52.2%) in 2024. The percentage of individuals who are married is highest in Himachal Pradesh (59.5%) and lowest in Jammu & Kashmir (45.9%). The percentage of individuals who are widowed/divorced/separated is highest in Tamil Nadu (8.2%) and lowest in Bihar and Jammu & Kashmir (1.9%).

2.20 The percentage of males above 10 years who were never married in 2024 is highest in Jammu and Kashmir (56.2%) and lowest in Tamil Nadu (39.4%). The percentage of married males during 2024 is found to highest in Tamil Nadu (57.3%) and lowest in Jammu & Kashmir (42.8%). The widowed/divorced/separated status in case of males is highest in Tamil Nadu (3.3%) and lowest in Jammu & Kashmir (1.0%) followed by Delhi (1.1%) and Haryana (1.2%). In case of females, the highest percentage of never married is found in Jammu & Kashmir (48.1%) and lowest in Kerala (26.5%). The highest proportion of married females is found in Himachal Pradesh (64.0%) and lowest in Jammu & Kashmir (49.1%). The widowed/divorced/separated status in case of females is highest in Tamil Nadu (13.0%) and lowest in Bihar (2.5%). Chart 15, 16 and 17 shows the distribution of population aged 10 years and above by marital status of India and bigger States/UTs for Person, Male and Female respectively.

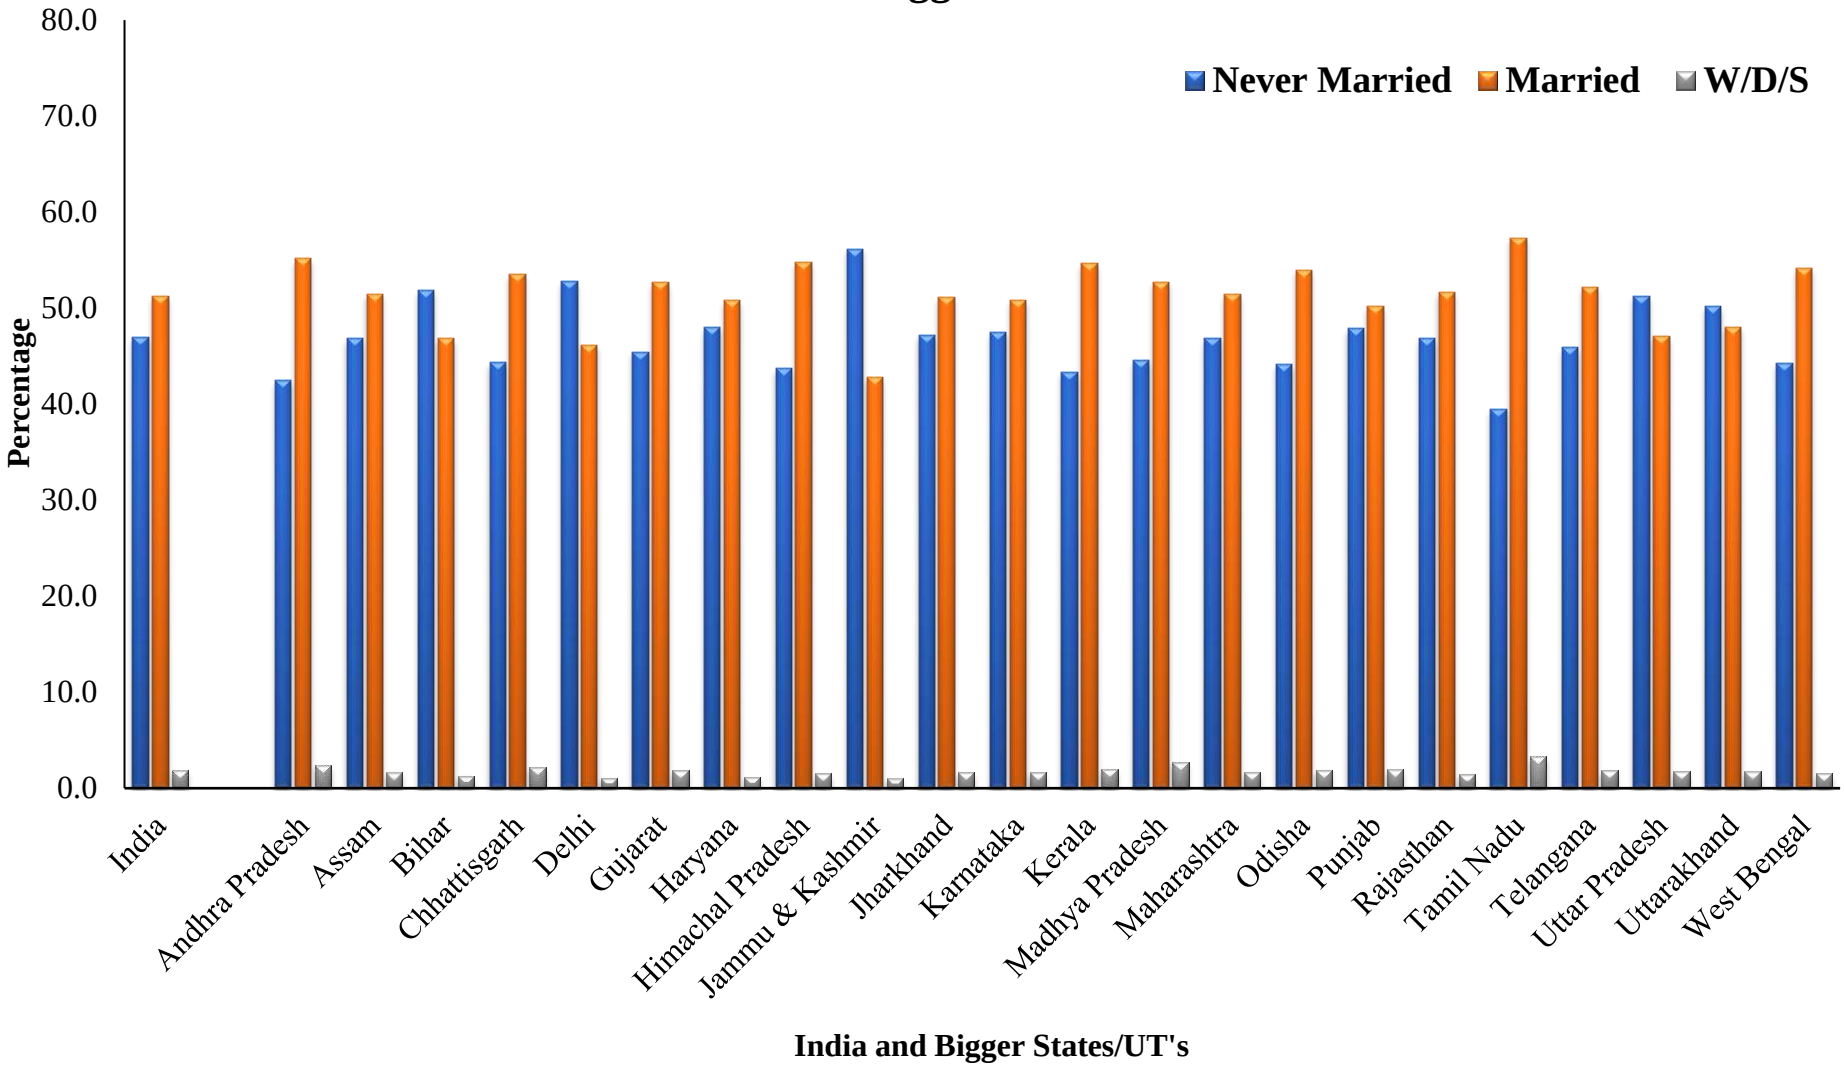

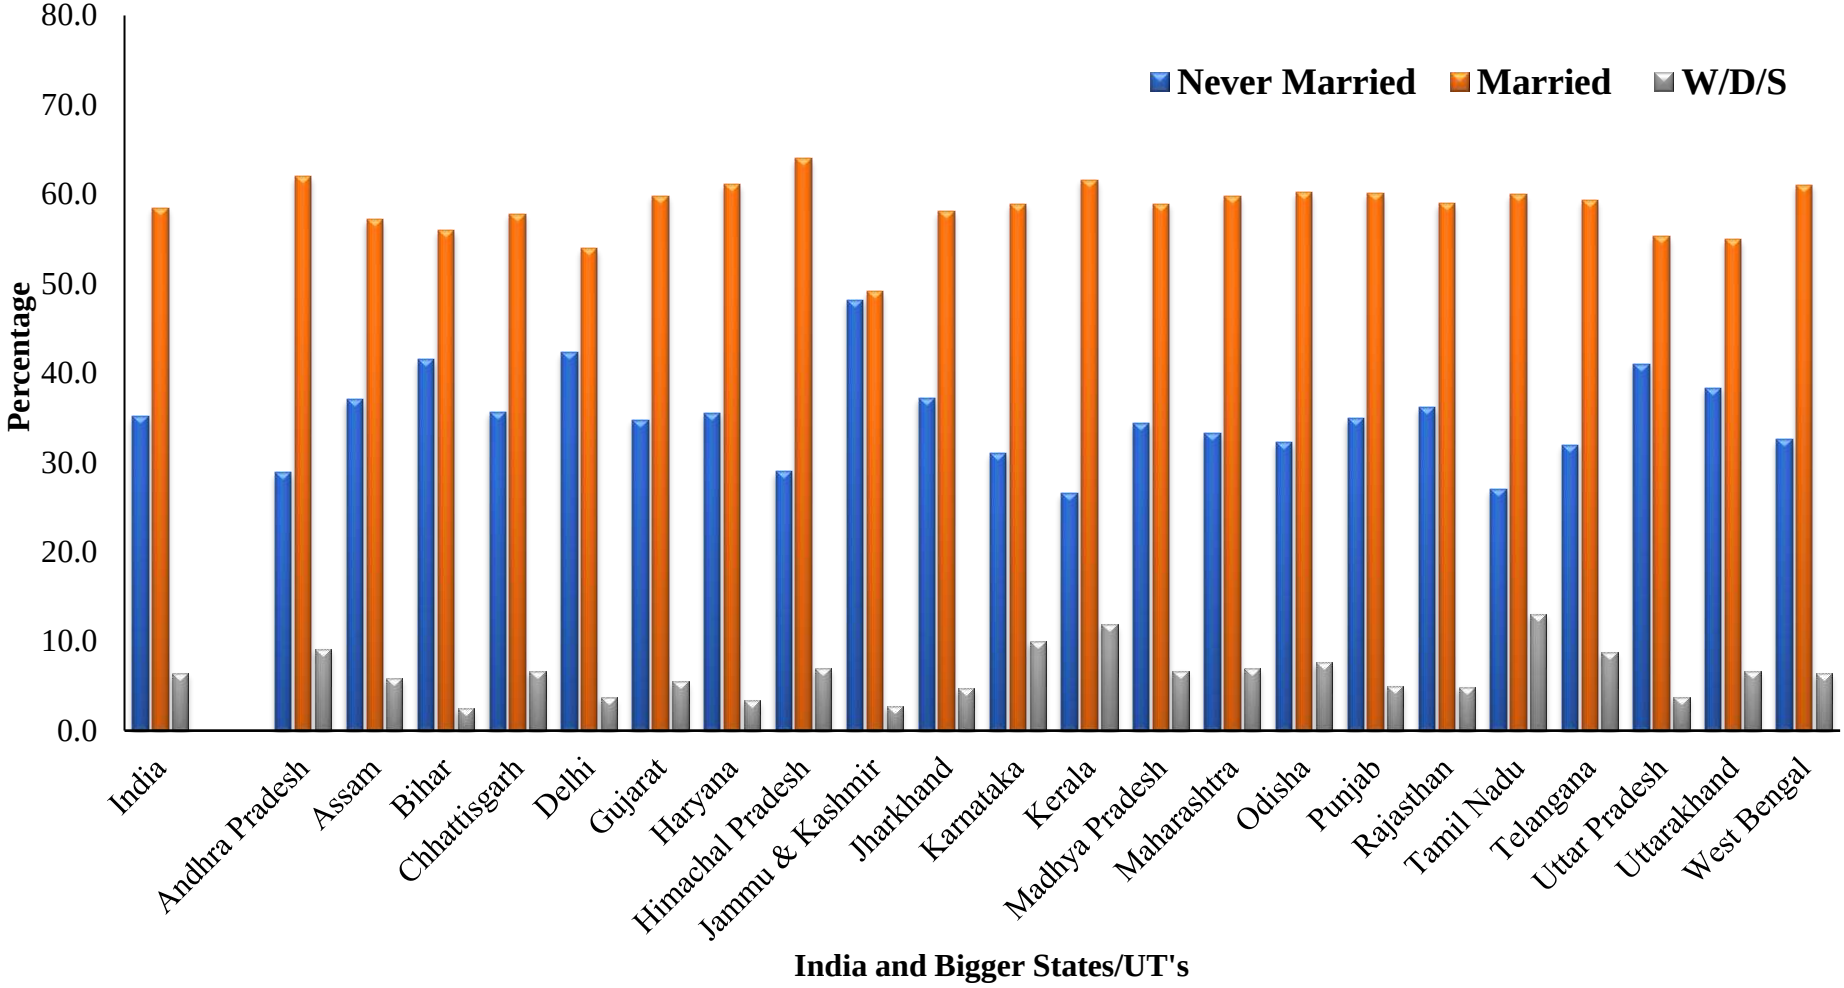

Chart 17: Percentage Distribution of Female-Population aged 10+ years by Marital Status, India and Bigger States/UTs, 2024

2.21 Statement 10 placed below shows the percentage distribution of Females aged 10 years and more by marital status and residence in India and bigger States/UTs in 2024. At the National level, 35.1% of females aged 10 and above were never married, 58.5% were married and 6.4% were either widowed, divorced or separated. In terms of residence, 35.3% of rural females and 34.8 % of urban females were never married, 58.6% of rural females and 58.2% of urban females were married and 6.1% of rural females and 7.0% of urban females were either widowed, divorced or separated.

2.22 Among the bigger States/UTs, the proportion of never-married females is lowest in Kerala (26.5%) and highest in Jammu & Kashmir (48.1%). The proportion of married females is lowest in Jammu & Kashmir (49.1%) and highest in Himachal Pradesh (64.0%). The proportion of widowed/divorced/separated females is highest in Tamil Nadu (13.0%) and lowest in Bihar (2.5%). Charts 18 and 19 show the distribution of the female population aged 10 years and above by marital status of India and bigger States/UTs for Rural and Urban areas respectively.

Chart 20: Percentage Distribution of Female aged 15+ years by Marital Status, India and Bigger States/UTs, 2024

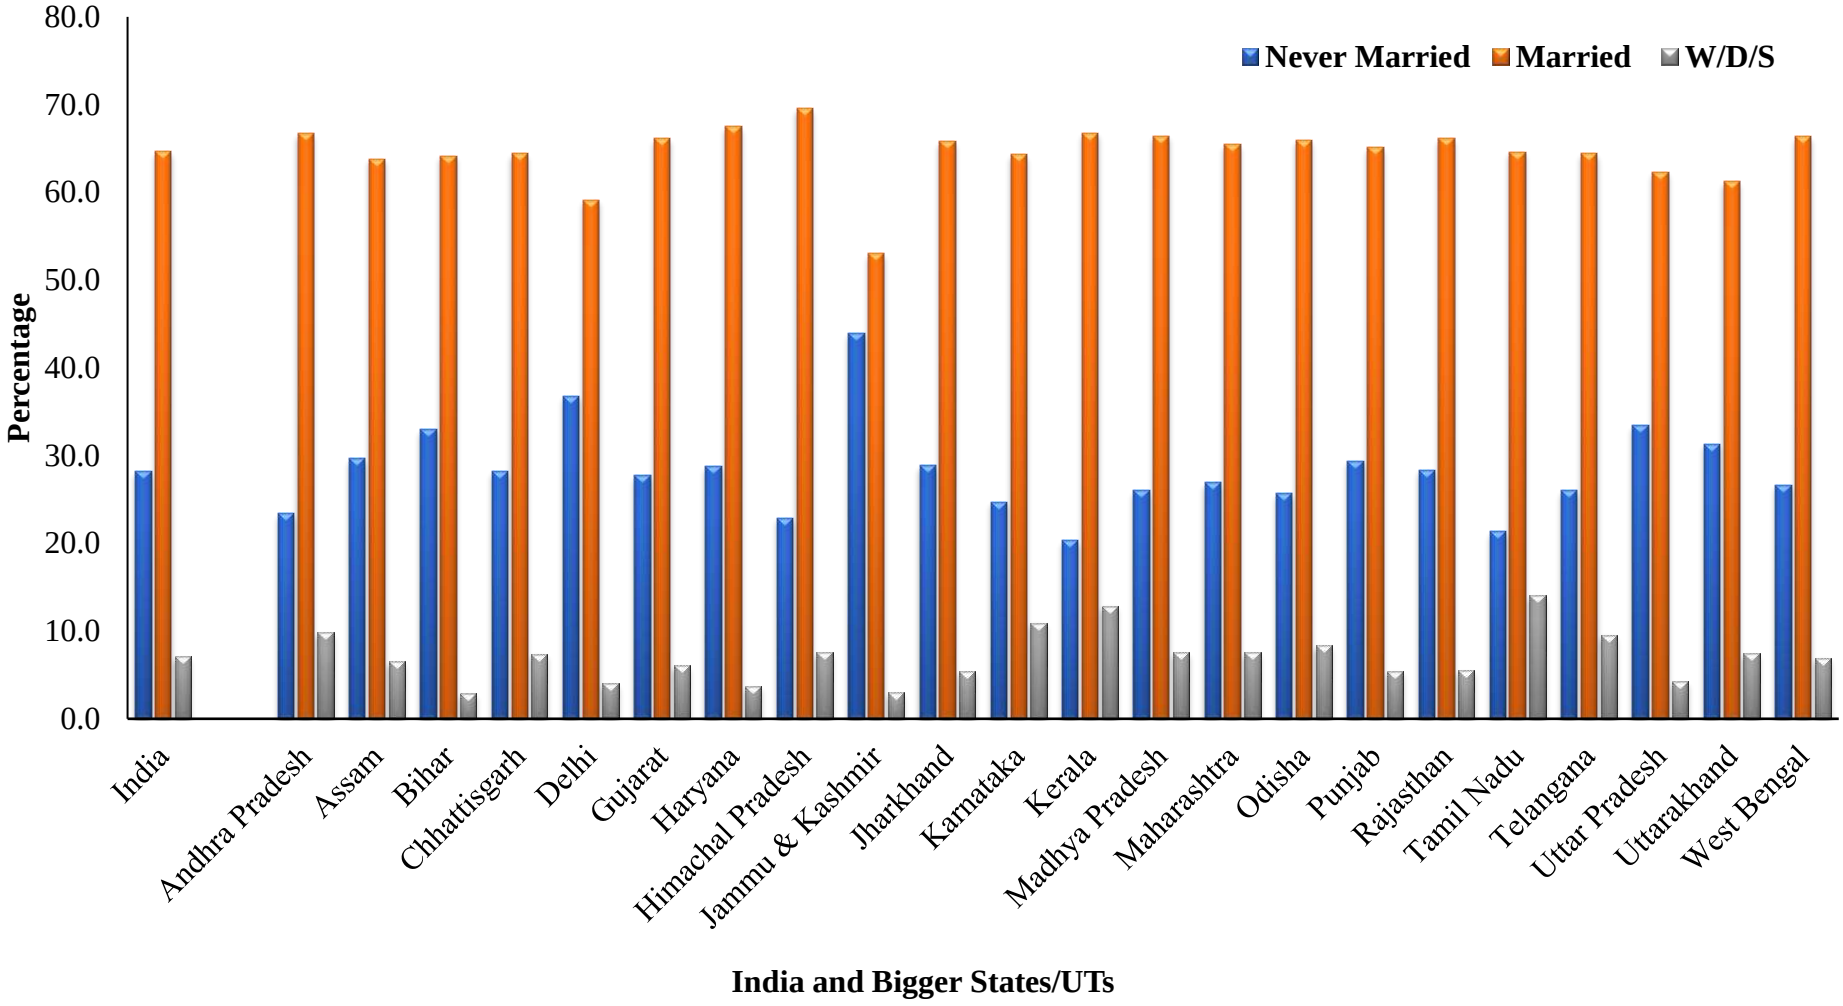

Chart 21: Percentage Distribution of Female aged 15+ years by Marital Status, India and Bigger States/UTs, 2024 - Rural

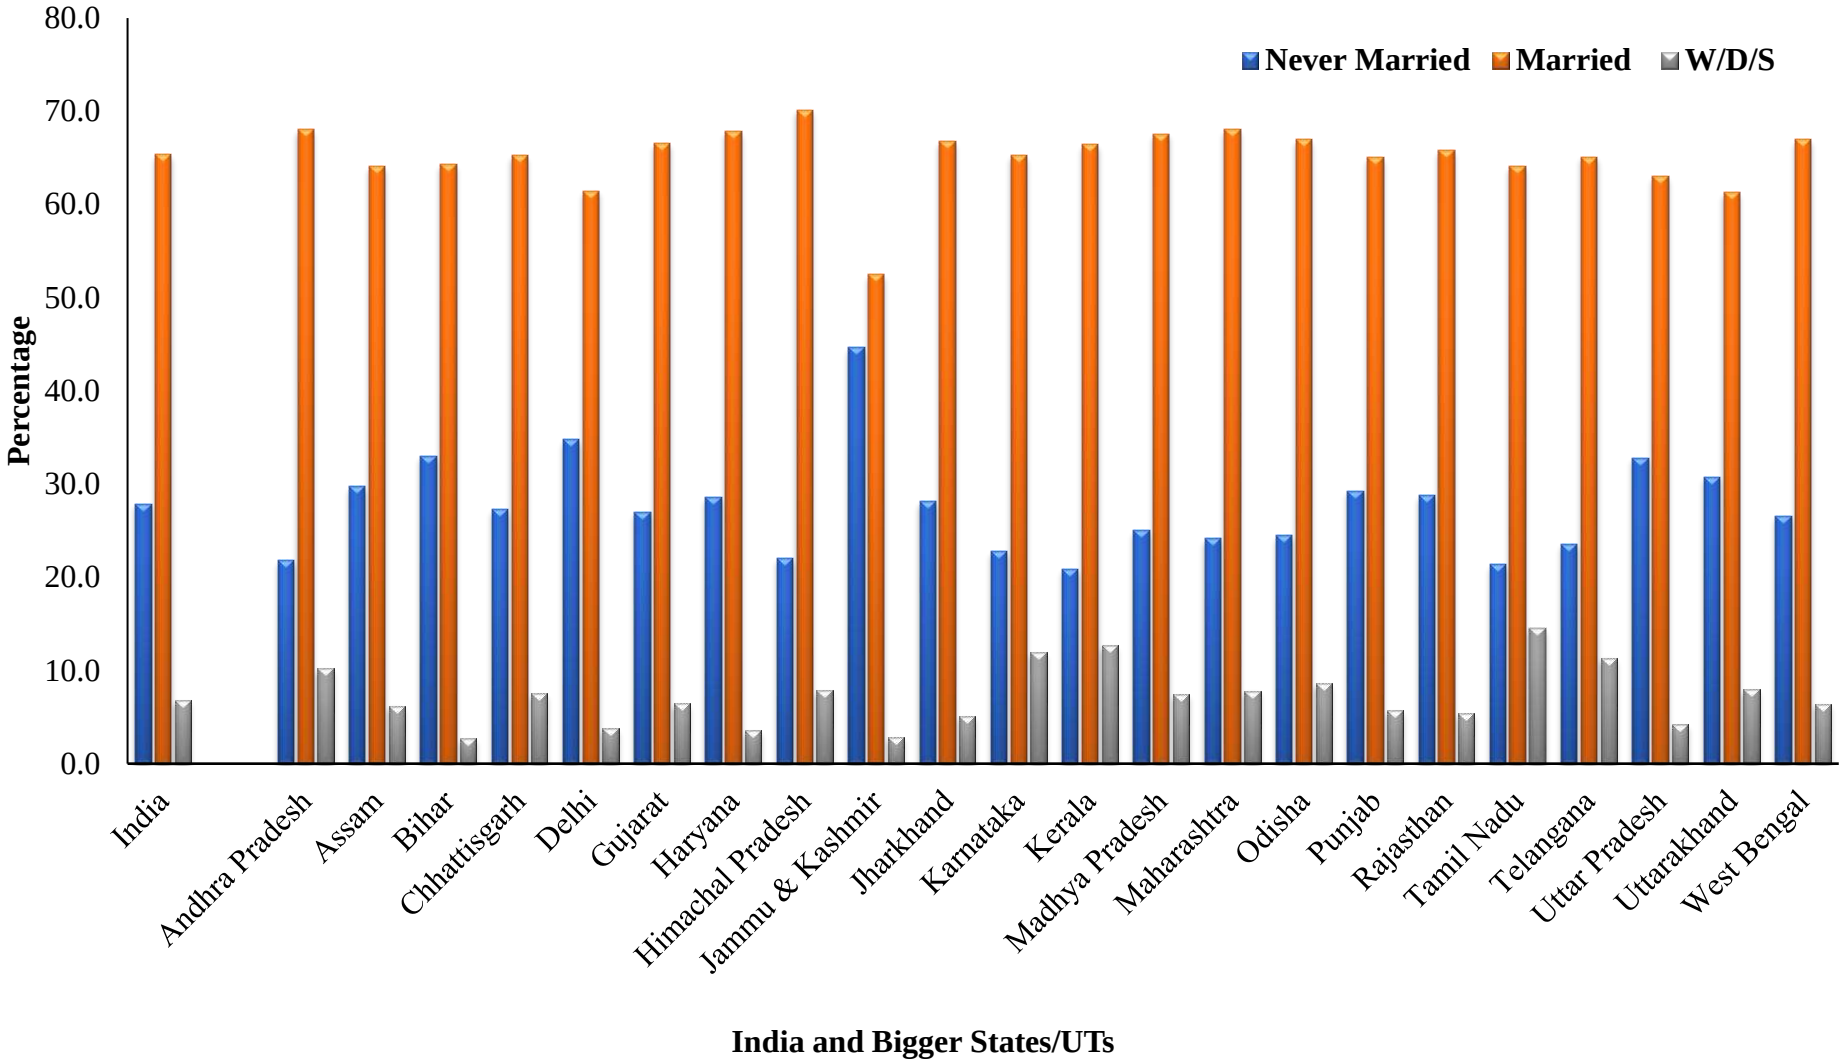

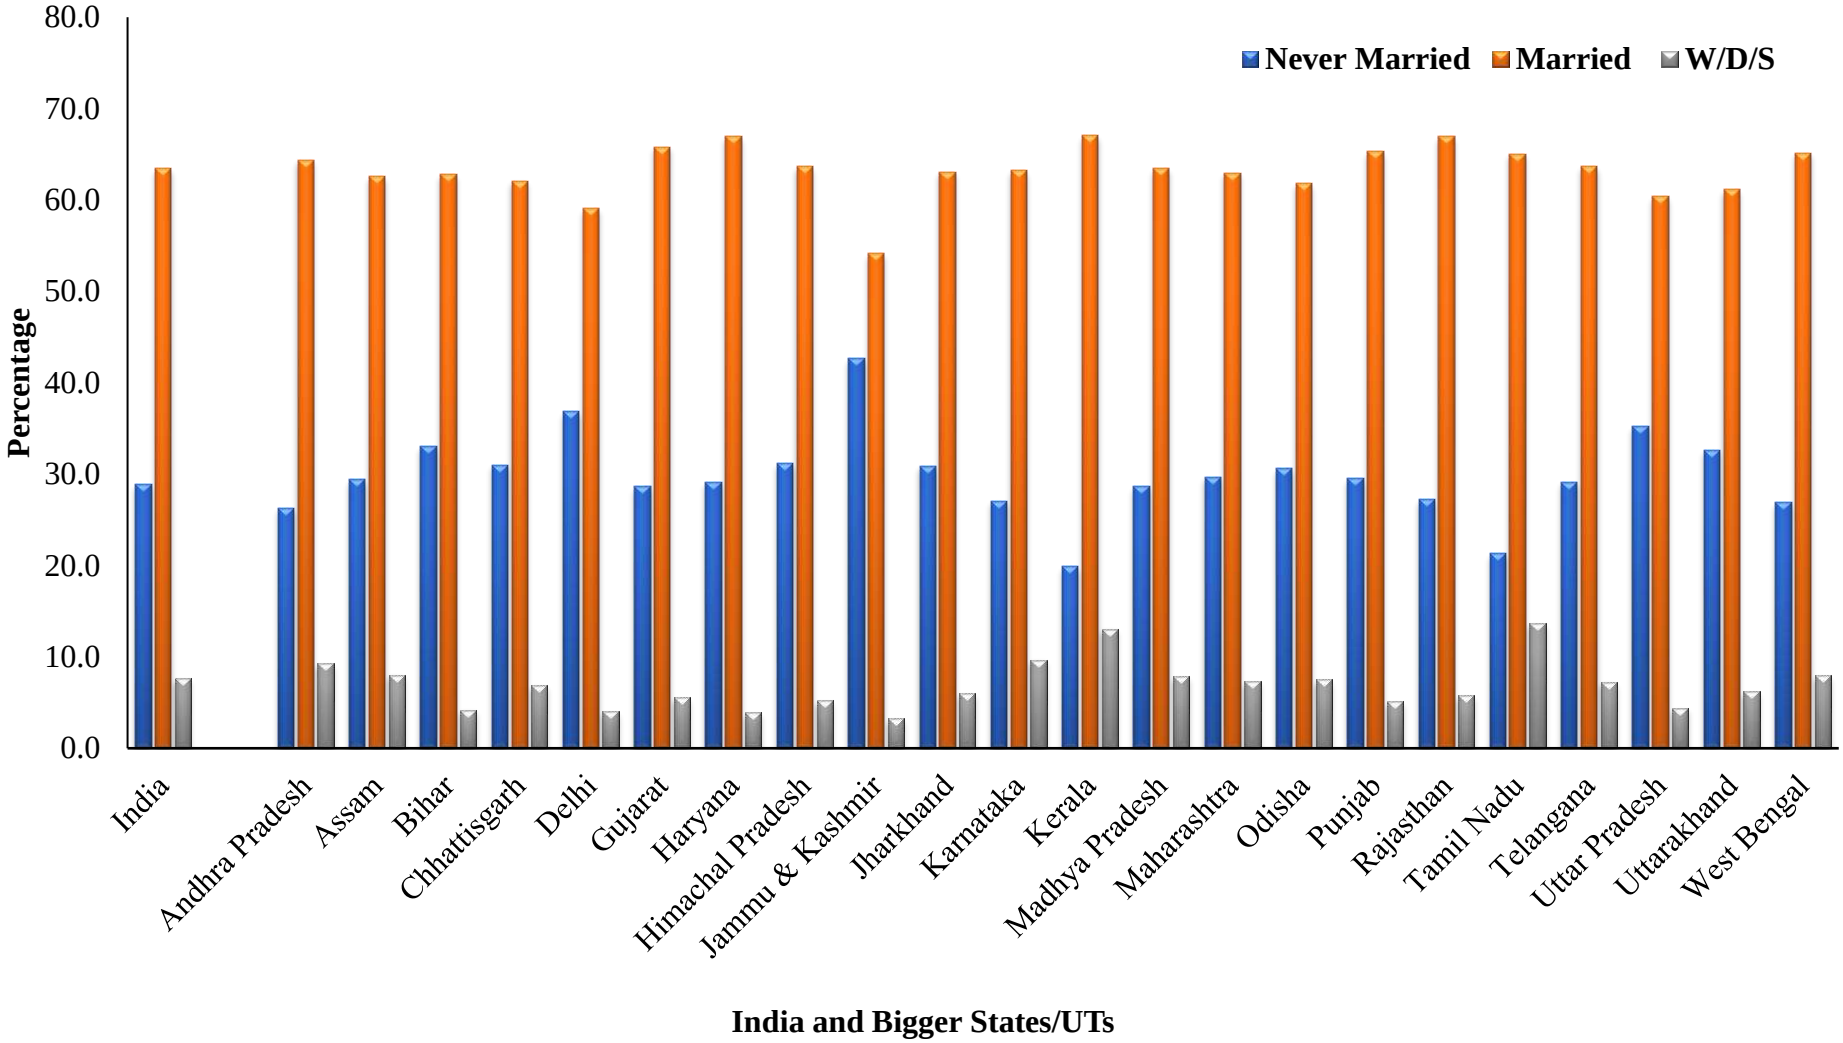

Chart 22: Percentage Distribution of Female aged 15+ years by Marital Status, India and Bigger States/UTs, 2024 - Urban

2.25 Since 1990, the Sample Registration System (SRS) has been systematically collecting data on the marital status of both males and females, as well as on the number of females who entered into effective marriage during each six-month reference period of the half yearly survey. Based on this information, the mean age at effective marriage for females has been estimated for 2024. Statement 12 presents the percentage distribution of these females by age at effective marriage, classified into three categories: below 18 years, 18–20 years, and 21 years or above. The data is disaggregated by rural and urban areas to highlight regional variations.

2.26 At the National level, 2.1% of females got married before the age of 18, 24.5% got married between the ages of 18-20 and 73.5% got married at the age of 21 or above. In rural areas, the corresponding percentages are 2.4%, 27.4% and 70.2% respectively, while in urban areas, they are 1.1%, 16.6%, and 82.2% respectively.

2.27 Amongst the Bigger States/UTs, the highest proportion of females getting married before the age of 18 is observed in West Bengal (6.3%) followed by Jharkhand (4.9%) and the lowest is observed in Delhi at 0% and Kerala at 0.04% followed by Himachal Pradesh and Haryana recorded at 0.4% and 0.7% respectively. The highest proportion of females getting married in the age interval 18-20 years is observed in West Bengal (44.5%) followed by Jharkhand (40.5%) and the lowest in Jammu & Kashmir (9.4%). The proportion of females getting married at the age of 21 or above is the highest in Jammu & Kashmir (89.4%) followed by Himachal Pradesh (86.2%) and the lowest in West Bengal (49.2%) followed by Jharkhand (54.7%).

2.28 In rural areas, the highest percentage of females marrying before the age of 18 is recorded in West Bengal (5.9%), followed by Jharkhand (5.8%). The lowest percentages are observed in Delhi (0.0%) and Kerala (0.1%). In urban areas, West Bengal again reports the highest proportion of females marrying before 18 years (7.6%), followed by Jammu & Kashmir (2.9%) and Odisha (2.8%). The lowest percentages in urban areas are found in Haryana, Himachal Pradesh, Delhi, and Kerala (each 0.0%), followed by Karnataka (0.1%) and Madhya Pradesh (0.5%). Charts 23, 24, and 25 illustrate the age distribution at effective marriage of females for India and for the bigger States and Union Territories, disaggregated by total, rural, and urban areas respectively.

Chart 23: Percentage of Females by Age at Effective Marriage, India and Bigger States/UTs, 2024

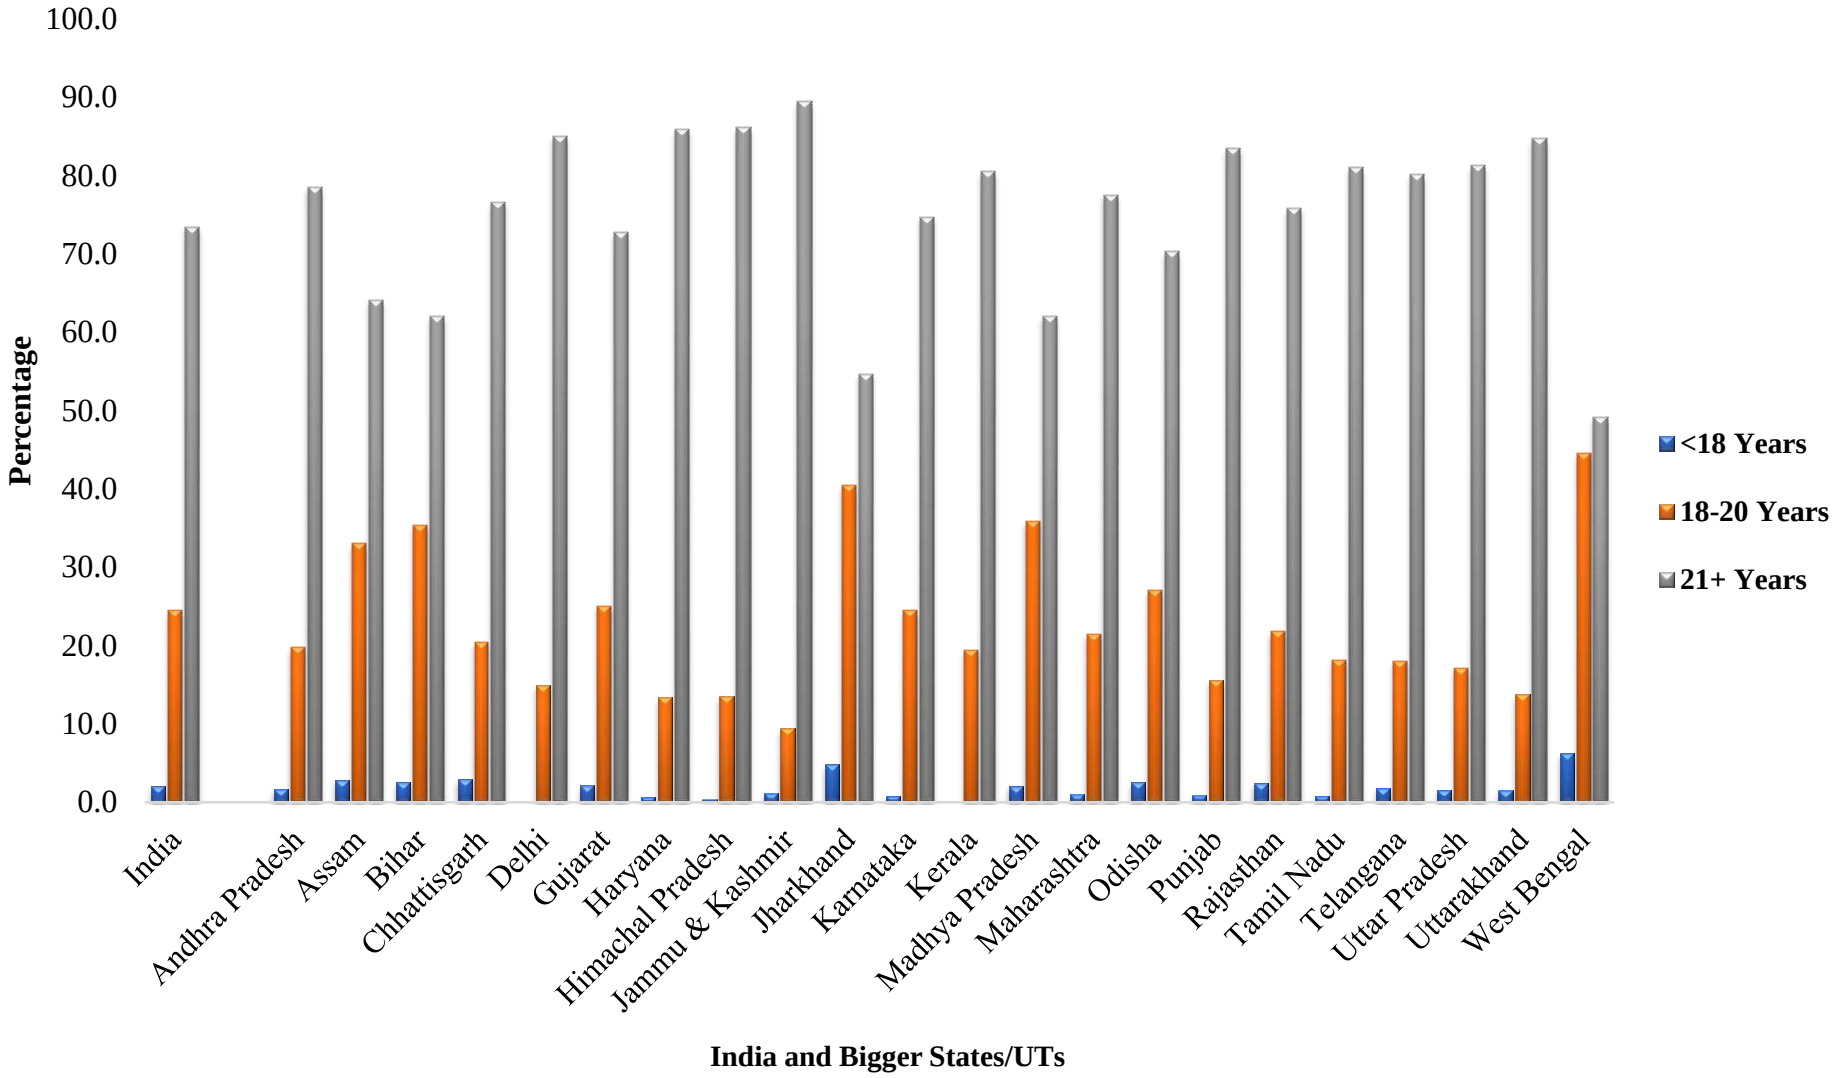

Chart 24: Percentage of Females by age at Effective Marriage, India and Bigger States/UTs, 2024 - Rural

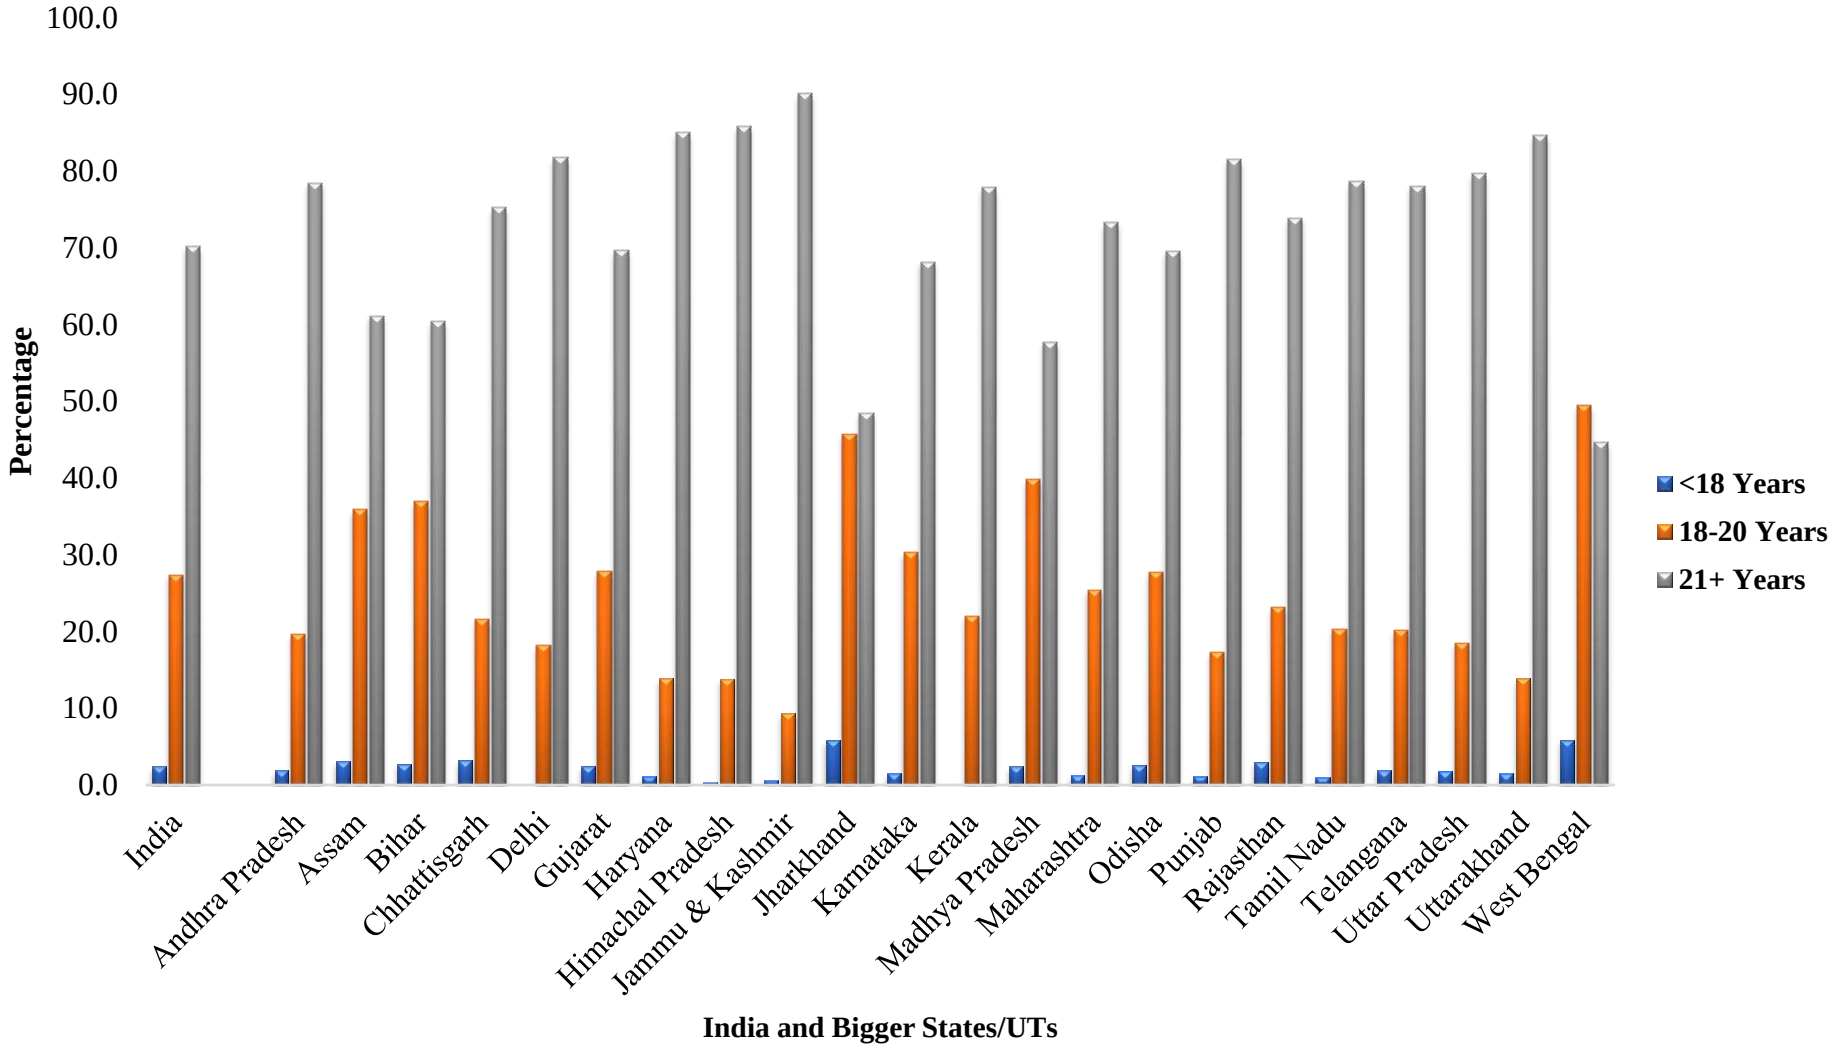

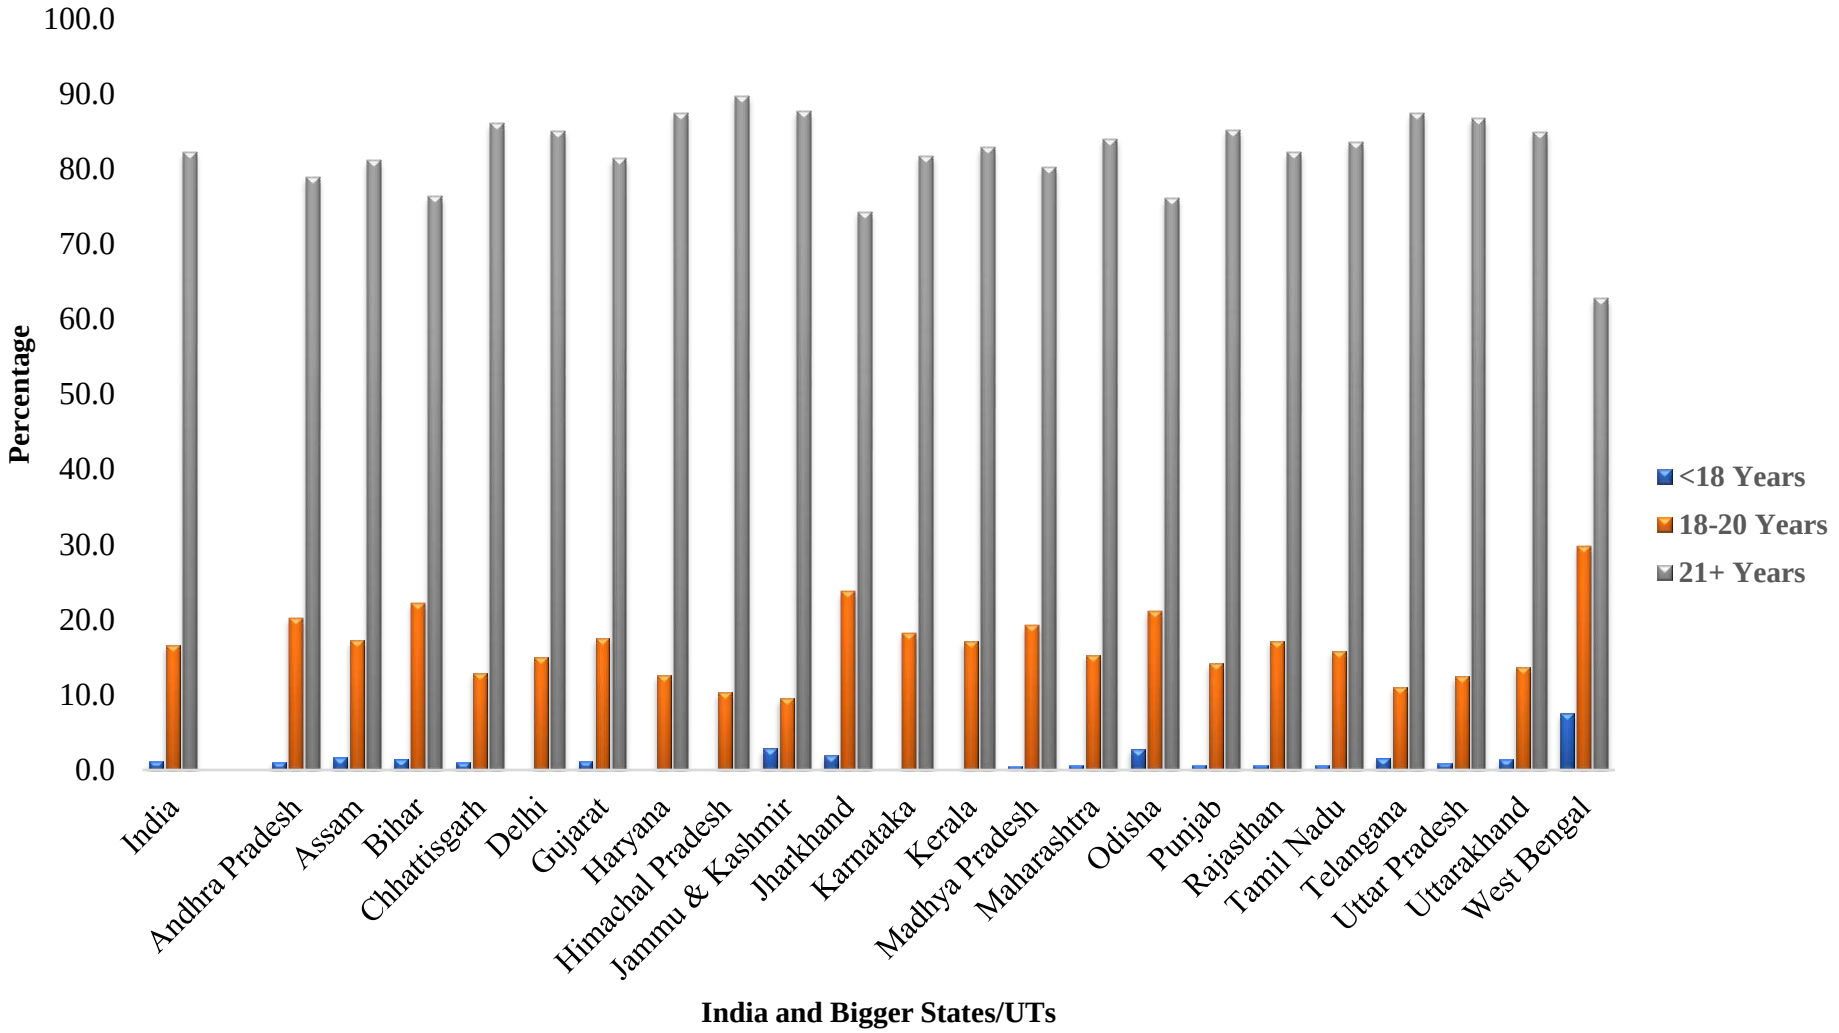

Chart 25: Percentage of Females by age at Effective Marriage, India and Bigger States/UTs, 2024 - Urban

2.29 Statement 13 presents the mean age at effective marriage among females by place of residence for India and the bigger States and Union Territories for the year 2024. The data is categorized into four age groups: below 18 years, 18–20 years, 21 years and above, and all ages combined. At the National level, the mean age at effective marriage for females is 23.1 years, indicating that, on an average, females in India marry at this age. A notable disparity exists between rural and urban areas, with the mean age being 22.6 years in rural areas and 24.4 years in urban areas. This urban-rural gap is consistently observed across India and within individual States and Union Territories, where females in urban areas tend to marry at a later age compared to their rural counterparts.

2.30 In the majority of States and Union Territories, most females marry after the age of 18. However, in certain States such as West Bengal, Jharkhand, and Chhattisgarh, a considerable percentage of females continue to marry before reaching 18 years of age. The mean age at effective marriage also exhibits substantial variation across States, ranging from 21.5 years in Jharkhand to 26.7 years in Jammu & Kashmir.

2.31 It is evident that, in most States and Union Territories, the mean age at effective marriage for females is higher in urban areas as compared to rural areas except for Jammu & Kashmir, and Punjab. Among rural areas, Jammu & Kashmir reports the highest mean age at effective marriage at 26.9 years, followed by Punjab (25.2) years. Conversely, the lowest mean age at effective marriage in rural areas are observed in Jharkhand (21.0 years), West Bengal (21.0 years), and Bihar (21.5 years) for all ages.

2.32 In urban areas, the highest mean age at effective marriage is recorded in Jammu & Kashmir (26.1 years), followed by Assam (25.4) years, and Himachal Pradesh (25.2 years) for all ages. The lowest mean age at effective marriage in urban areas are seen in Bihar (23.0 years), and Jharkhand (23.1 years). Charts 26, 27, and 28 illustrates the distribution of females who were effectively married in the past year, by age at effective marriage, for India and the bigger States and Union Territories across total, rural, and urban areas respectively.

CHAPTER 3

ESTIMATES OF FERTILITY INDICATORS

SRS has been providing data for estimating various fertility measures since its inception. The fertility indicators considered in this chapter are Crude Birth Rate, General Fertility Rate, Age-Specific Marital Fertility Rates, Total Marital Fertility Rates and Gross Reproduction Rate. Apart from this, the chapter includes Sex Ratio at Birth. To examine the changes in the levels of fertility during the last decade, the average values of these fertility indicators for the years 2022-24 are compared with that for 2012-14.

3.2 The Crude Birth Rate (CBR) at all India level had declined from 36.9 in 1971 to 33.9 in 1981, registering a fall of about 8.1 percent. In the next three decades ending 1991, 2001 and 2011, the Crude Birth Rate reached 29.5, 25.4 and 21.8 respectively. During the period 2011-2024, there was around 16.1 per cent decline in Crude Birth Rate, from 21.8 in 2011 to 18.3 in 2024. The CBR has been continued to be higher in rural areas compared to urban areas except Kerala, Goa, Sikkim, Dadra and Nagar Haveli and Daman & Diu (DNH & DD), Puducherry though the rural-urban differential in CBR has narrowed down over these years, from a difference of 8.6 in 1981 to 5.5 in 2024.

3.3 The Total Fertility Rate (TFR) has declined from 5.2 to 4.5 during 1971 to 1981 and from 3.6 to 1.9 during 1991 to 2024. The TFR in rural areas has declined from 5.4 to 2.1 from 1971 to 2024 whereas the corresponding decline in urban areas has been from 4.1 to 1.5 during the same period. In 2024, around 95.4 percent of the deliveries were institutional which includes Government as well as private hospitals. The percentage of institutional deliveries in urban areas was 97.9 as against about 94.6 percent recorded in rural areas. The data on most of the fertility indicators have been presented by age, sex and residence for all bigger States/UTs and India. This chapter also includes data on fertility by level of education, order of birth, birth interval and medical attention at the time of birth.

3.4 Apart from the fertility indicators at State and National levels, the SRS report 2024 also provides estimates of birth rates at Sub-State, viz. NSS Natural Division Level. NSS Natural Divisions have been formed taking into consideration the geography of the State and by grouping contiguous districts having similar topography, population density, cropping pattern and rainfall etc. Table 11 of this report contains data on the birth rate besides Death and Infant Mortality Rate for 71 Natural Divisions of 22 bigger States/UTs.

3.5 The following Statement 14 provides the Crude Birth Rate (CBR) by residence for India and States/UTs for the year 2024. Although the birth rate has been estimated for all the States/UTs of India, the other fertility indicators are presented only for bigger States/UTs in the report. The CBR for India was 18.3 in 2024, with a higher rate in rural areas (20.2) compared to urban areas (14.7). Among the Bigger States/UTs, Bihar had the highest CBR of 26.8 , followed by Uttar Pradesh (23.5), and Rajasthan (22.8). The lowest CBR in this group was in Kerala (11.1) followed by Tamil Nadu (11.6), and Delhi (12.8).

3.6 Among the Smaller States/UTs, Meghalaya has the highest CBR of (22.1) followed by Arunachal Pradesh (16.3), whereas the lowest CBR in this group was in A & N Islands (9.9) followed by Goa (10.7).

Based on the figures in the Statement 14 given below, the graphical representation of Crude Birth Rate of States/UTs by residence is depicted in Chart 29. Chart 30 gives the distribution of States/UTs by values of birth rate for rural and urban areas.

Statement 14

CBR (Crude Birth Rate) by Residence, India and States/UTs, 2024

India and States/UTs	Total	Rural	Urban
India	**18.3**	**20.2**	**14.7**
Bigger States/UTs			
Andhra Pradesh	14.3	15.0	13.2
Assam	19.6	20.8	13.3
Bihar	26.8	27.5	21.8

Chart 29: CBR (Crude Birth Rate) by Residence, India and States/UTs, 2024

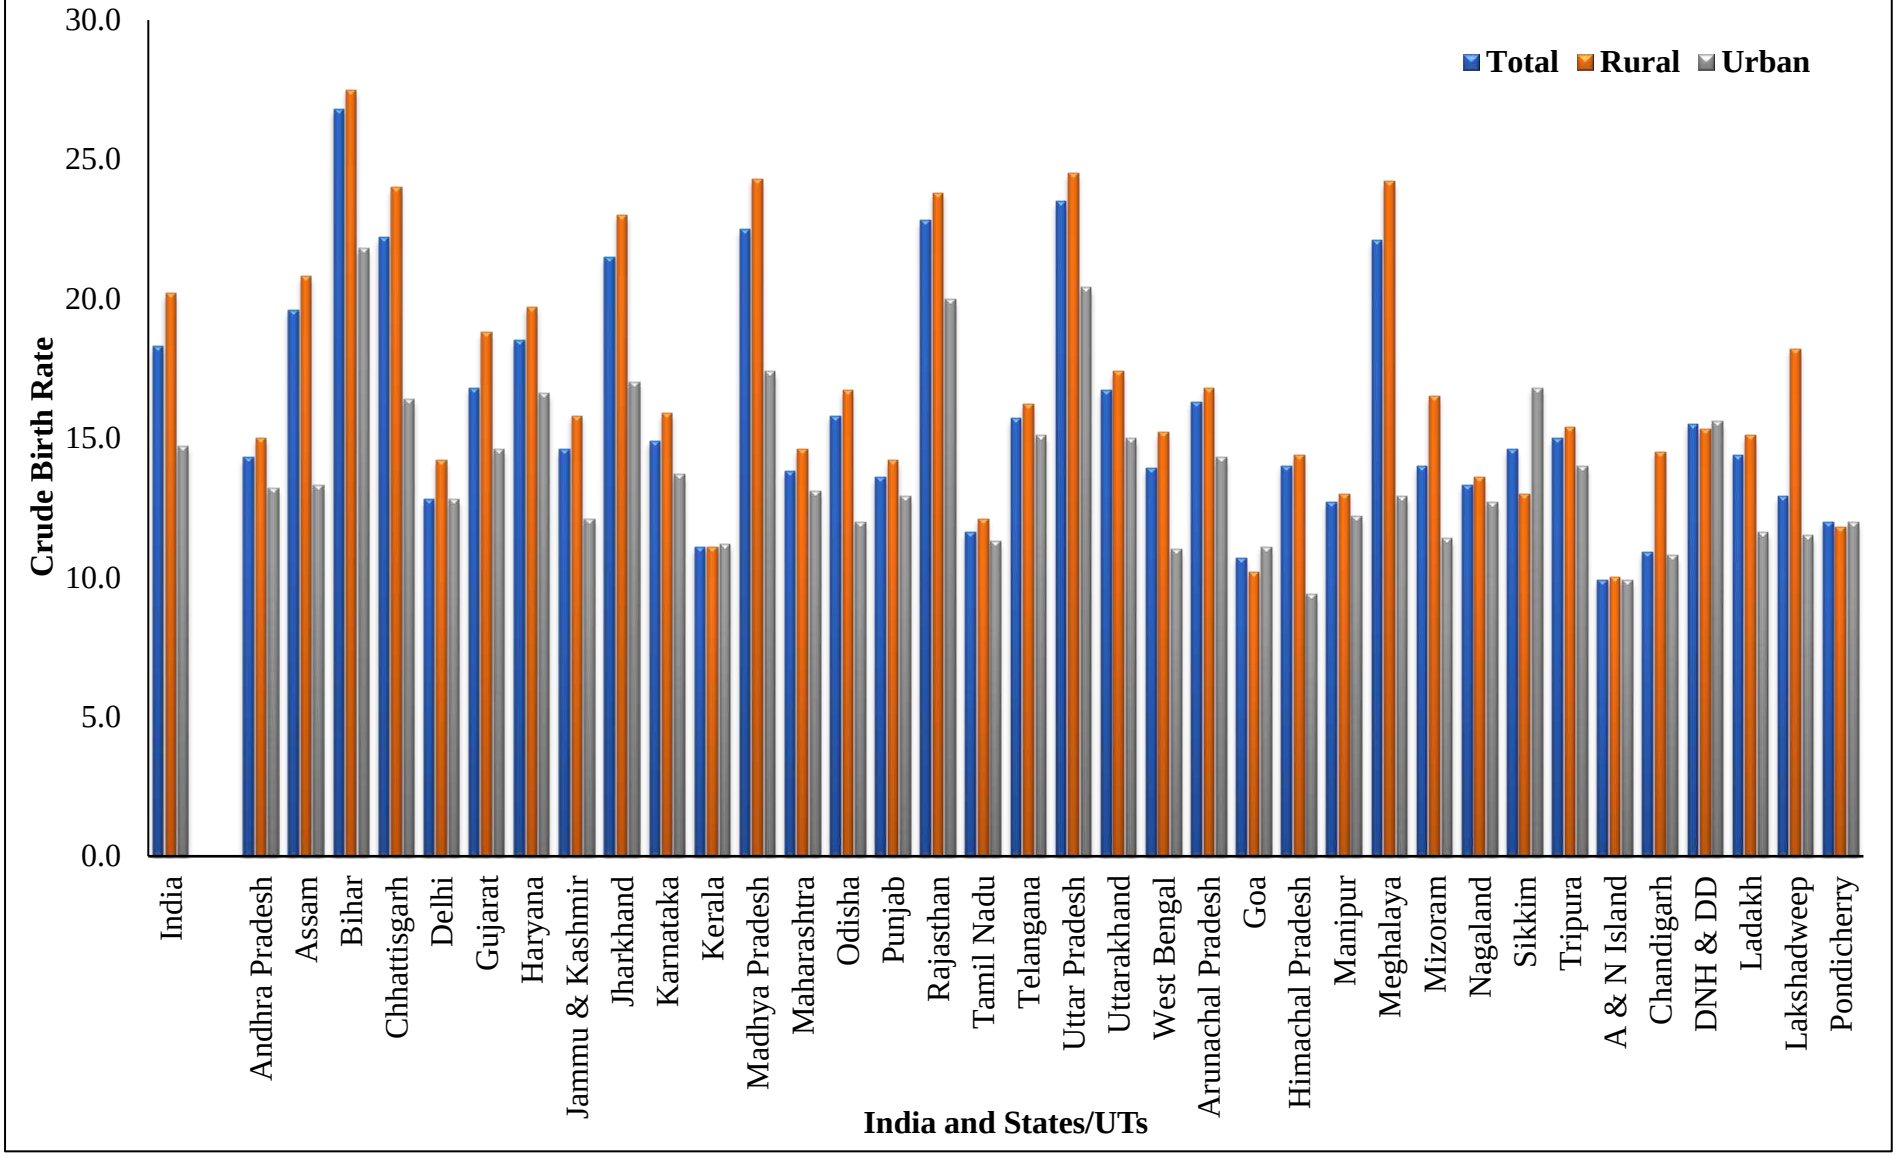

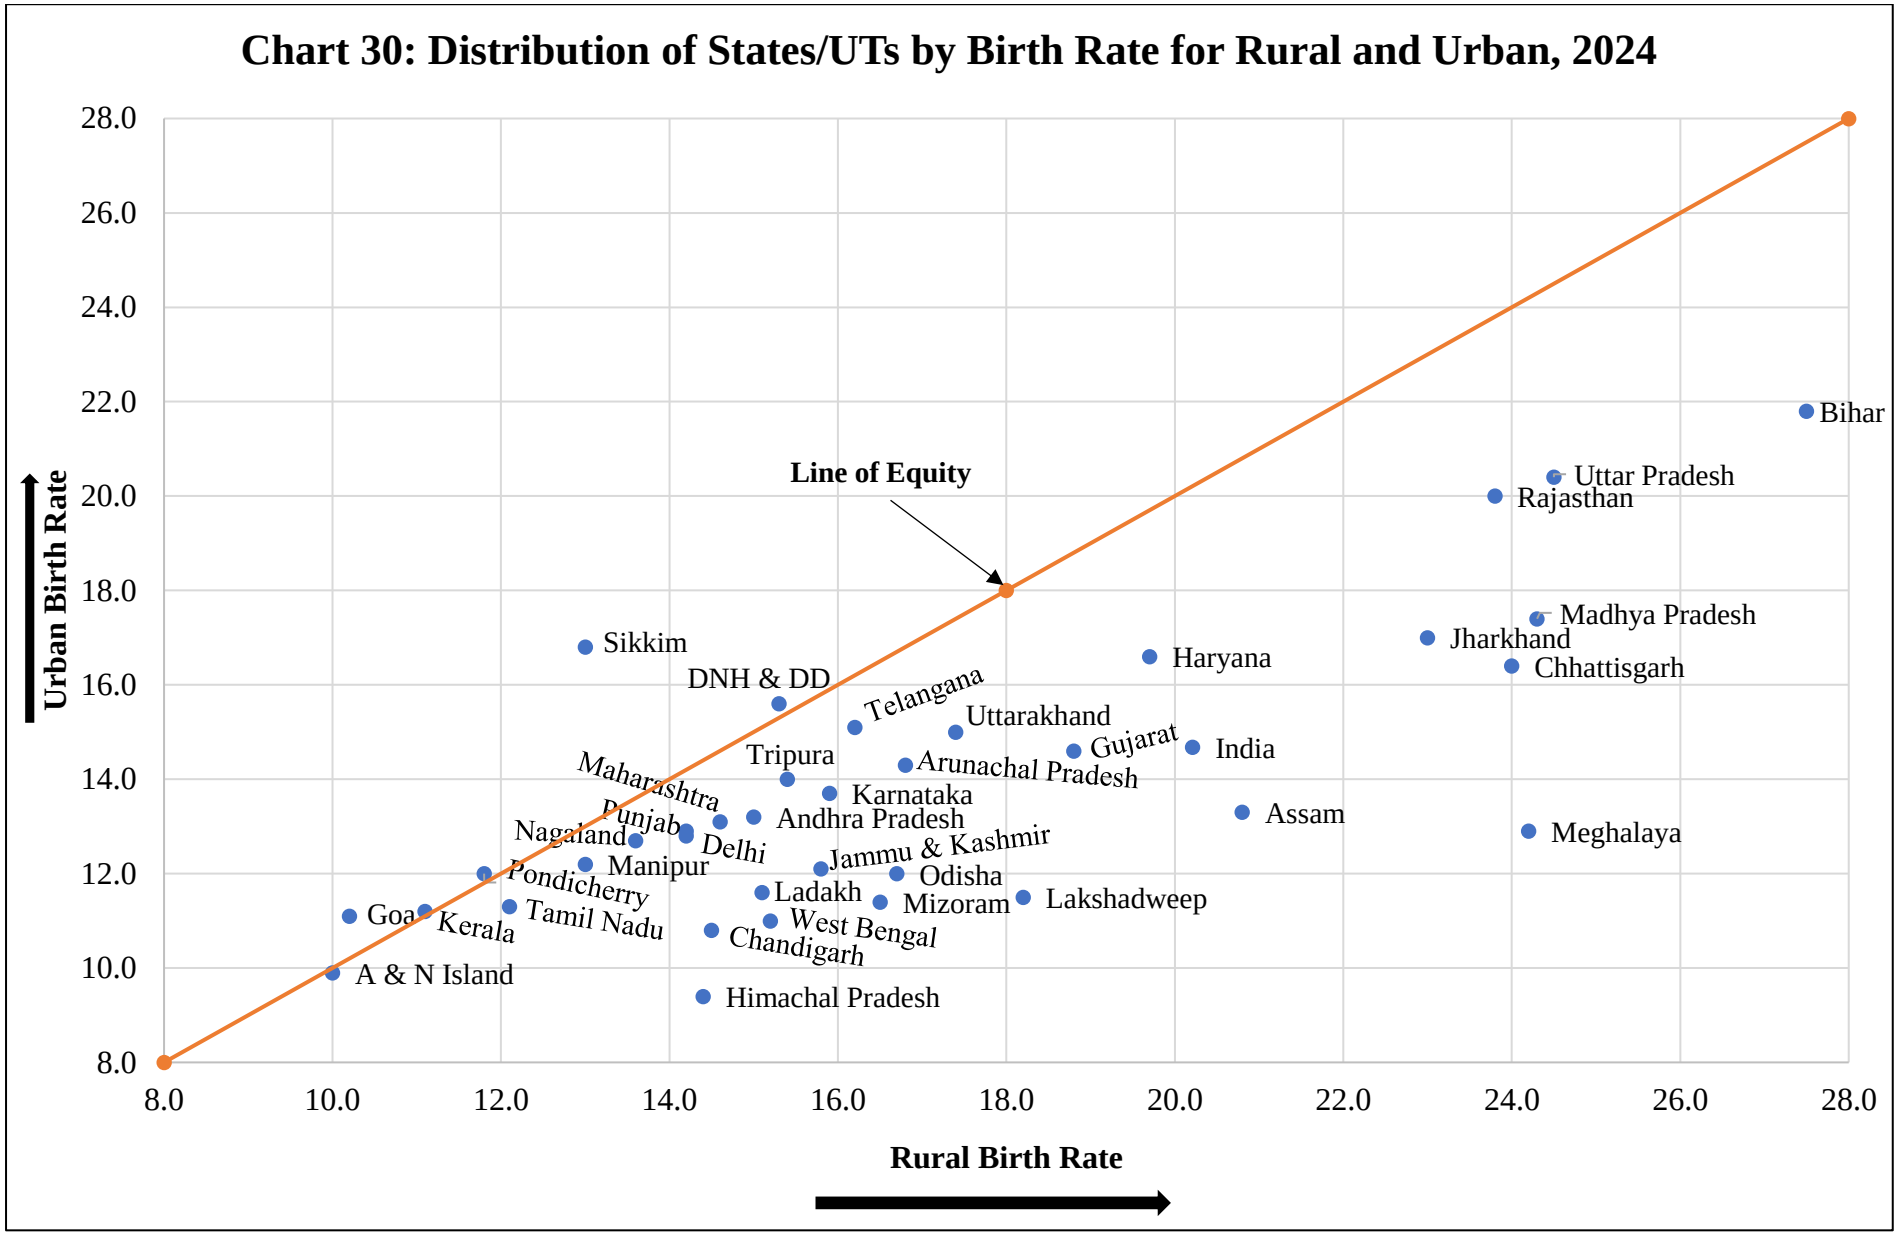

Chart 30: Distribution of States/UTs by Birth Rate for Rural and Urban, 2024

3.7 Statement 15 below provides the percentage change in Average Crude Birth Rate between the periods 2012-14 and 2022-24 for India and the bigger States/UTs separately for rural and urban areas. Between 2012-14 and 2022-24, there was an overall 12.7% decrease in the average CBR for India. Among the bigger States/UTs, the percentage change in the average CBR ranged from -24.0% for Delhi to -3.7% for Bihar. In terms of residence, the 3-year average Crude Birth Rate has declined in both rural and urban areas for all bigger States/UTs except for the State of Bihar (Urban). Further, the rural CBR was higher than the urban CBR in all bigger States/UTs except Kerala for 2022-24. The percentage change in rural CBR ranged from -23.0% for Delhi to -3.2% for Bihar whereas the percentage change in urban CBR ranged from -29.3% for Delhi to 1.0% for Bihar. Chart 31, 32 and 33 depict the average birth rate between 2012-14 and 2022-24 of India and bigger States/UTs for Total, Rural and Urban areas respectively along with respective rate of change. Chart 34 shows the year-wise birth rate from 1985 to 2024 by Residence for India.

Statement 15

Sex Ratio at Birth:

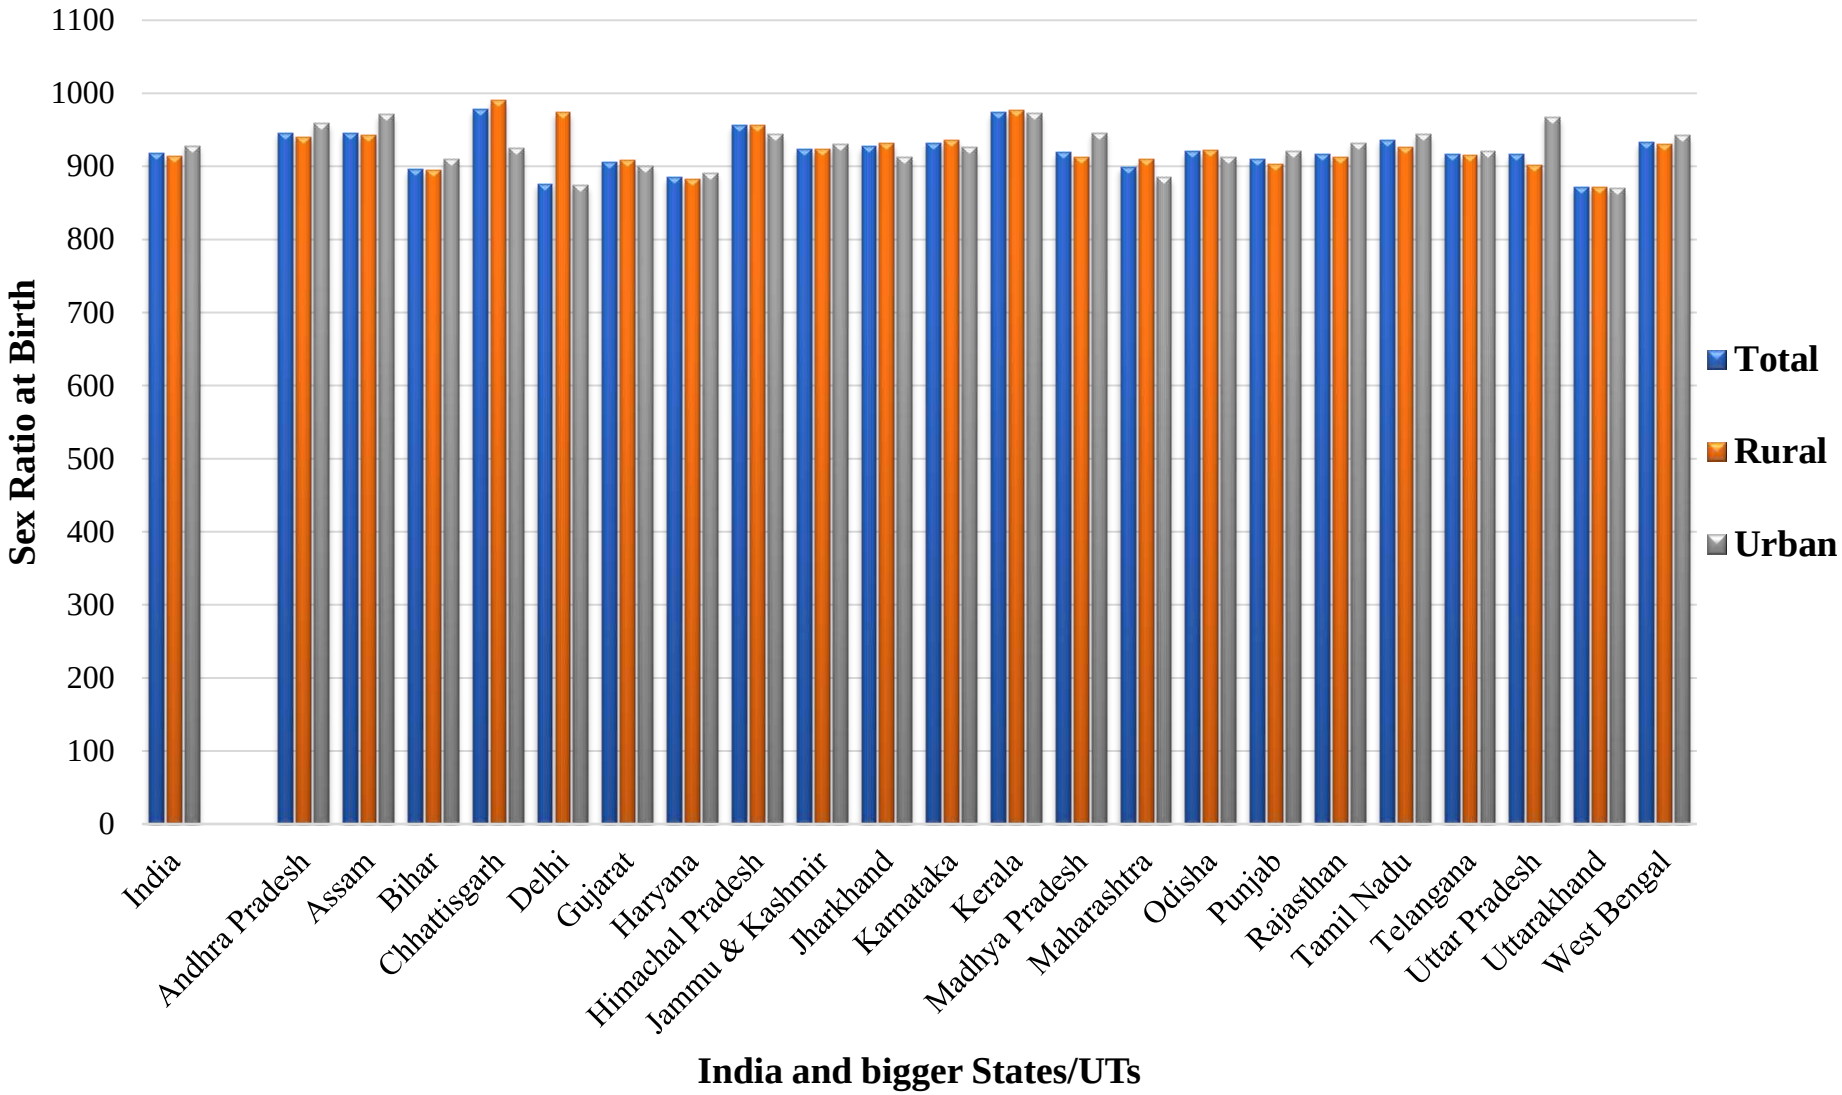

3.8 Statement 16 below presents Sex Ratio (number of females per 1000 males) at birth during the period 2022-24 in India and bigger States/UTs, categorized by residence. Overall, India had a Sex Ratio of 918 females per 1000 males at birth during the period 2022-24 (3-years average). Chhattisgarh and Kerala had the highest sex ratio at birth with 978 and 974 females per 1000 males respectively, while Uttarakhand has the lowest sex ratio at birth with 872 females per 1000 males. When categorized by residence, the urban areas had a higher sex ratio than the rural areas in 12 bigger States/UTs. In Delhi, the sex ratio was significantly lower in urban areas compared to rural areas. Chart 35 depicts the variation in Sex Ratio at Birth by residence among bigger States/UTs in the Country.

Statement 16

Sex Ratio (female per 1000 male) at Birth by Residence, India and Bigger States/UTs, 2022-24

Chart 35: Sex Ratio at Birth by Residence, India and Bigger States/UTs, 2022-24

General Fertility Rate:

3.9 Estimates of General Fertility Rate (GFR), a refined measure of fertility, being defined as the number of live births per thousand women in the reproductive age group 15-49 years, is a useful tool for measuring fertility. The GFR for all-India and bigger States/UTs for the year 2024 are given below in Statement 17, separately for rural and urban areas. The overall GFR for India was 63.6 in 2024, with higher rates in rural areas (71.1) compared to urban areas (49.8). Among the bigger States/UTs, Bihar had the highest GFR (98.7), followed by Uttar Pradesh (84.1) and Rajasthan (81.3). These States/UTs also had higher GFR in rural areas compared to urban areas. Further, Kerala had the lowest GFR among the bigger States/UTs (40.2). Chart 36 and 37 gives the distribution of GFR for bigger States/UTs in rural and urban areas.

Statement 17

GFR (General Fertility Rate) by Residence, India and Bigger States/UTs, 2024

India and Bigger States/UTs	Total	Rural	Urban
India	**63.6**	**71.1**	**49.8**
Andhra Pradesh	47.8	50.6	43.1
Assam	65.5	69.6	43.6
Bihar	98.7	101.5	80.3
Chhattisgarh	75.3	82.9	53.1
Delhi	42.3	47.8	42.2
Gujarat	58.9	67.0	50.1
Haryana	64.9	69.9	57.5
Himachal Pradesh	48.7	50.5	31.8

Odisha	54.1	57.9	38.9
Punjab	47.8	50.5	44.6
Rajasthan	81.3	84.9	70.5
Tamil Nadu	41.3	42.3	40.4
Telangana	51.0	53.3	48.2
Uttar Pradesh	84.1	89.2	69.8
Uttarakhand	59.5	62.7	51.7
West Bengal	44.5	48.4	35.7

Chart 36: General Fertility Rate (GFR) by Residence, India & Bigger States/UTs, 2024

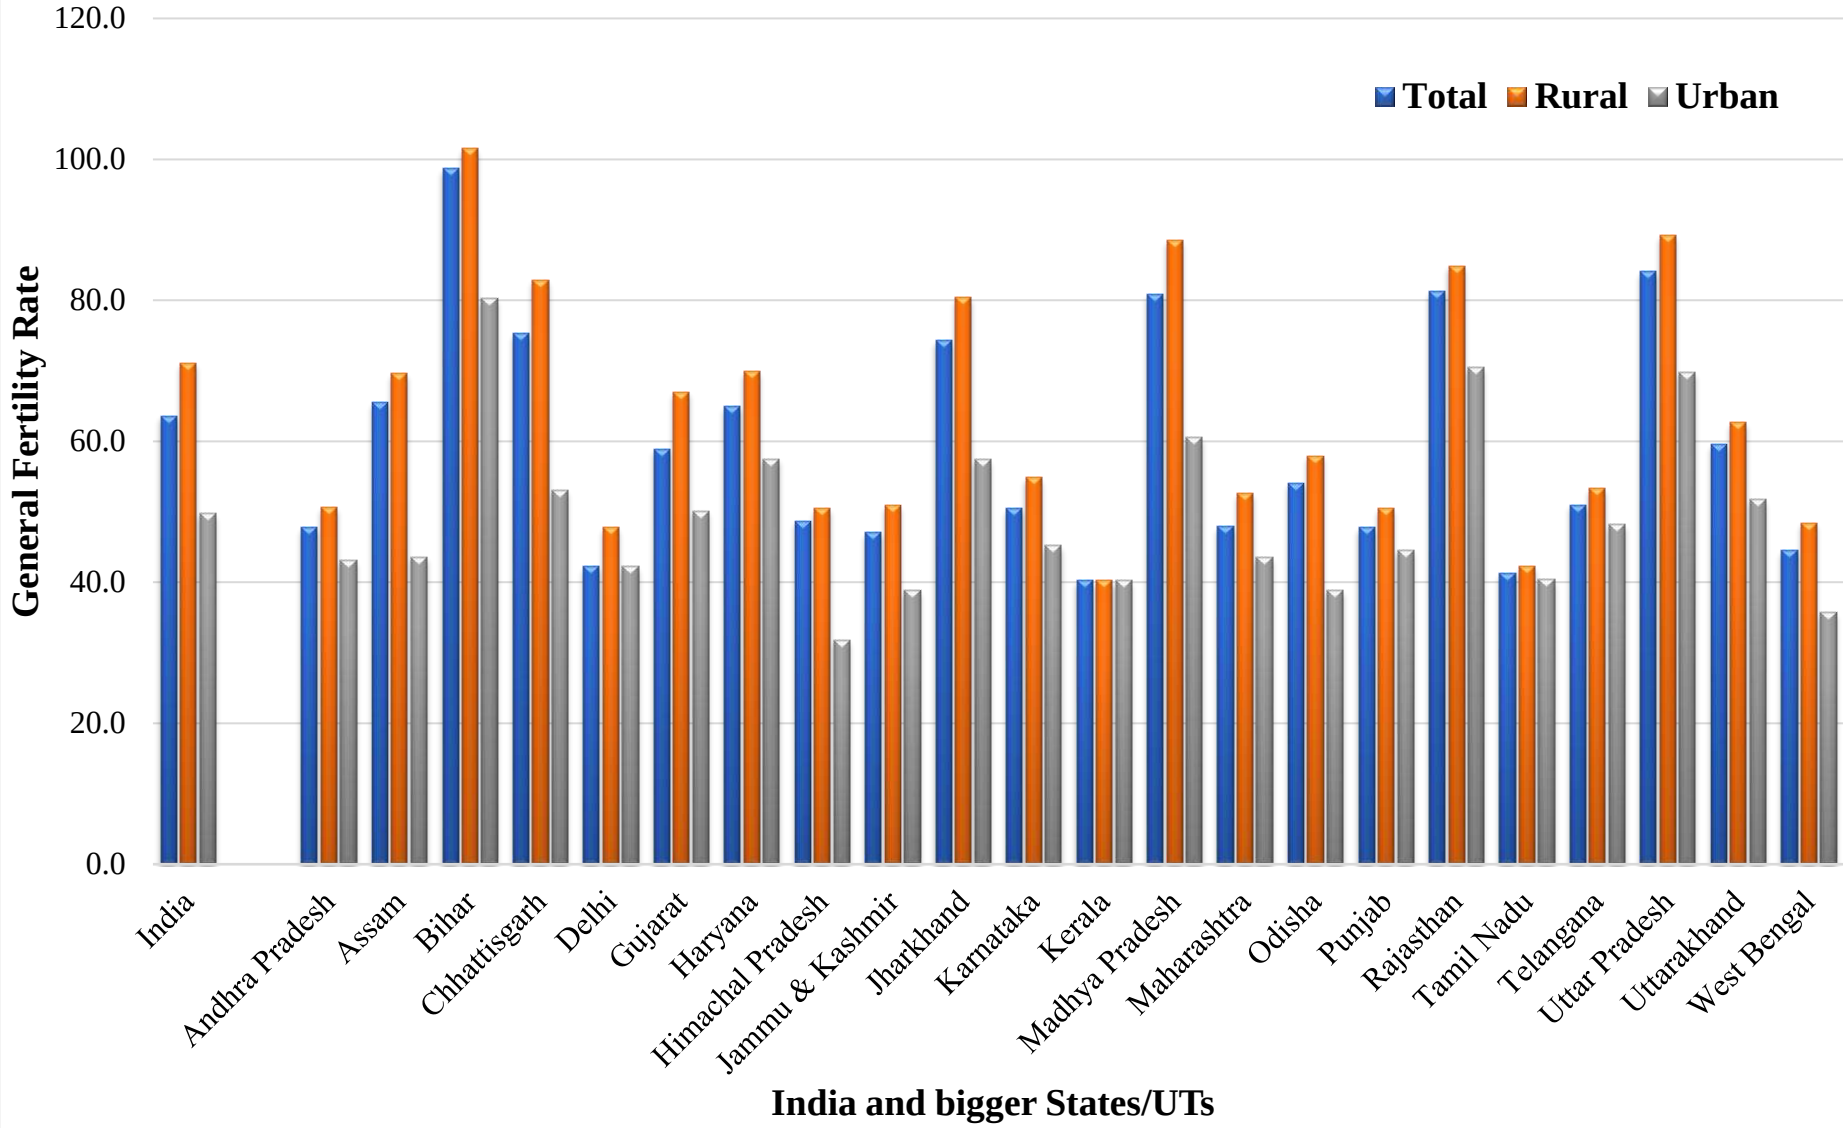

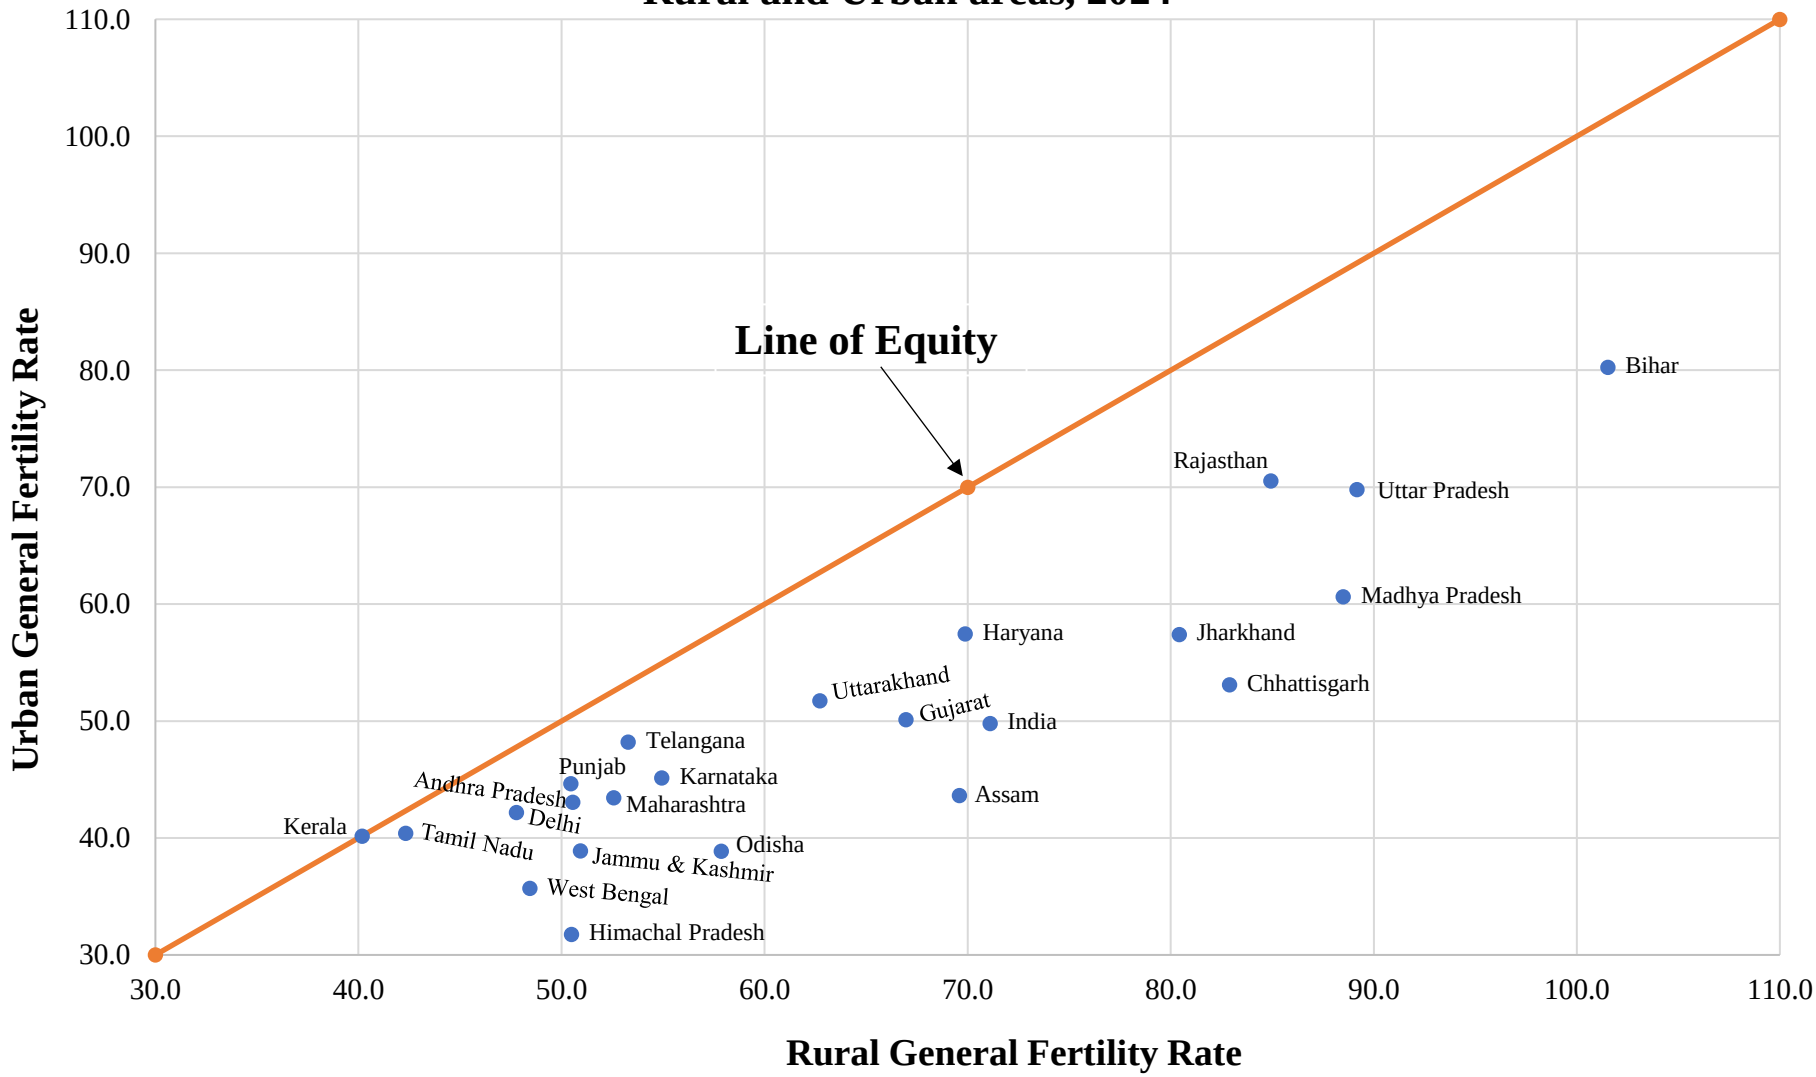

Chart 37: Distribution of bigger States/UTs by General Fertility Rate(GFR) for Rural and Urban areas, 2024

3.10 Changes in the average level of General Fertility Rate (GFR) between 2012-14 and 2022-24 for India and bigger States/UTs in terms of residence is given in Statement 18. Overall, the data shows that the GFR has decreased in India and in most of the bigger States/UTs between 2012-14 and 2022-24. The total GFR in India has decreased from 78.8 in 2012-14 to 64.6 in 2022-24, which represents a 18.0% decrease. The rural GFR has decreased by 16.6%, from 86.2 to 71.9, while the urban GFR has decreased by 16.7%, from 61.2 to 51.0.

3.11 Among the bigger States/UTs, Bihar had the highest GFR in both 2012-14 and 2022-24 of 105.4 and 96.0 respectively. Delhi has experienced the largest percent decrease among all States/UTs, with the GFR falling by 29.9% from 61.5 to 43.1. Kerala had the lowest GFR among all States/UTs in 2012-14 and Tamil Nadu had the lowest GFR among all States/UTs in 2022-24. Over the past 10 years, Bihar has experienced a slight increase of 2.1% in urban GFR, while Jammu & Kashmir recorded the smallest decline at 6.6%, followed by West Bengal (6.9%) and Rajasthan (11.0%). The highest decrease in urban GFR during last decade is observed in Delhi (35.6%) followed by Tamil Nadu (23.5%) and Odisha (19.8%). The smallest percent decrease in the rural GFR is observed in Bihar (10.1%) followed by Himachal Pradesh (12.3%), Chhattisgarh (12.4%) and Punjab (14.6%), while highest percent decrease in the rural GFR is observed in Delhi (28.9%) followed by Tamil Nadu (24.5%). Chart 38, 39 and 40 depicts the average GFR between 2012-14 and 2022-24 and percent change for India and bigger States/UTs for Total, Rural, and Urban areas respectively. Chart 41 shows the year-wise General Fertility Rate from 1985 to 2024 by residence for India.

Statement 18

Percent change in average GFR (General Fertility Rate) between 2012-14 and 2022-24 by Residence, India and Bigger States/UTs

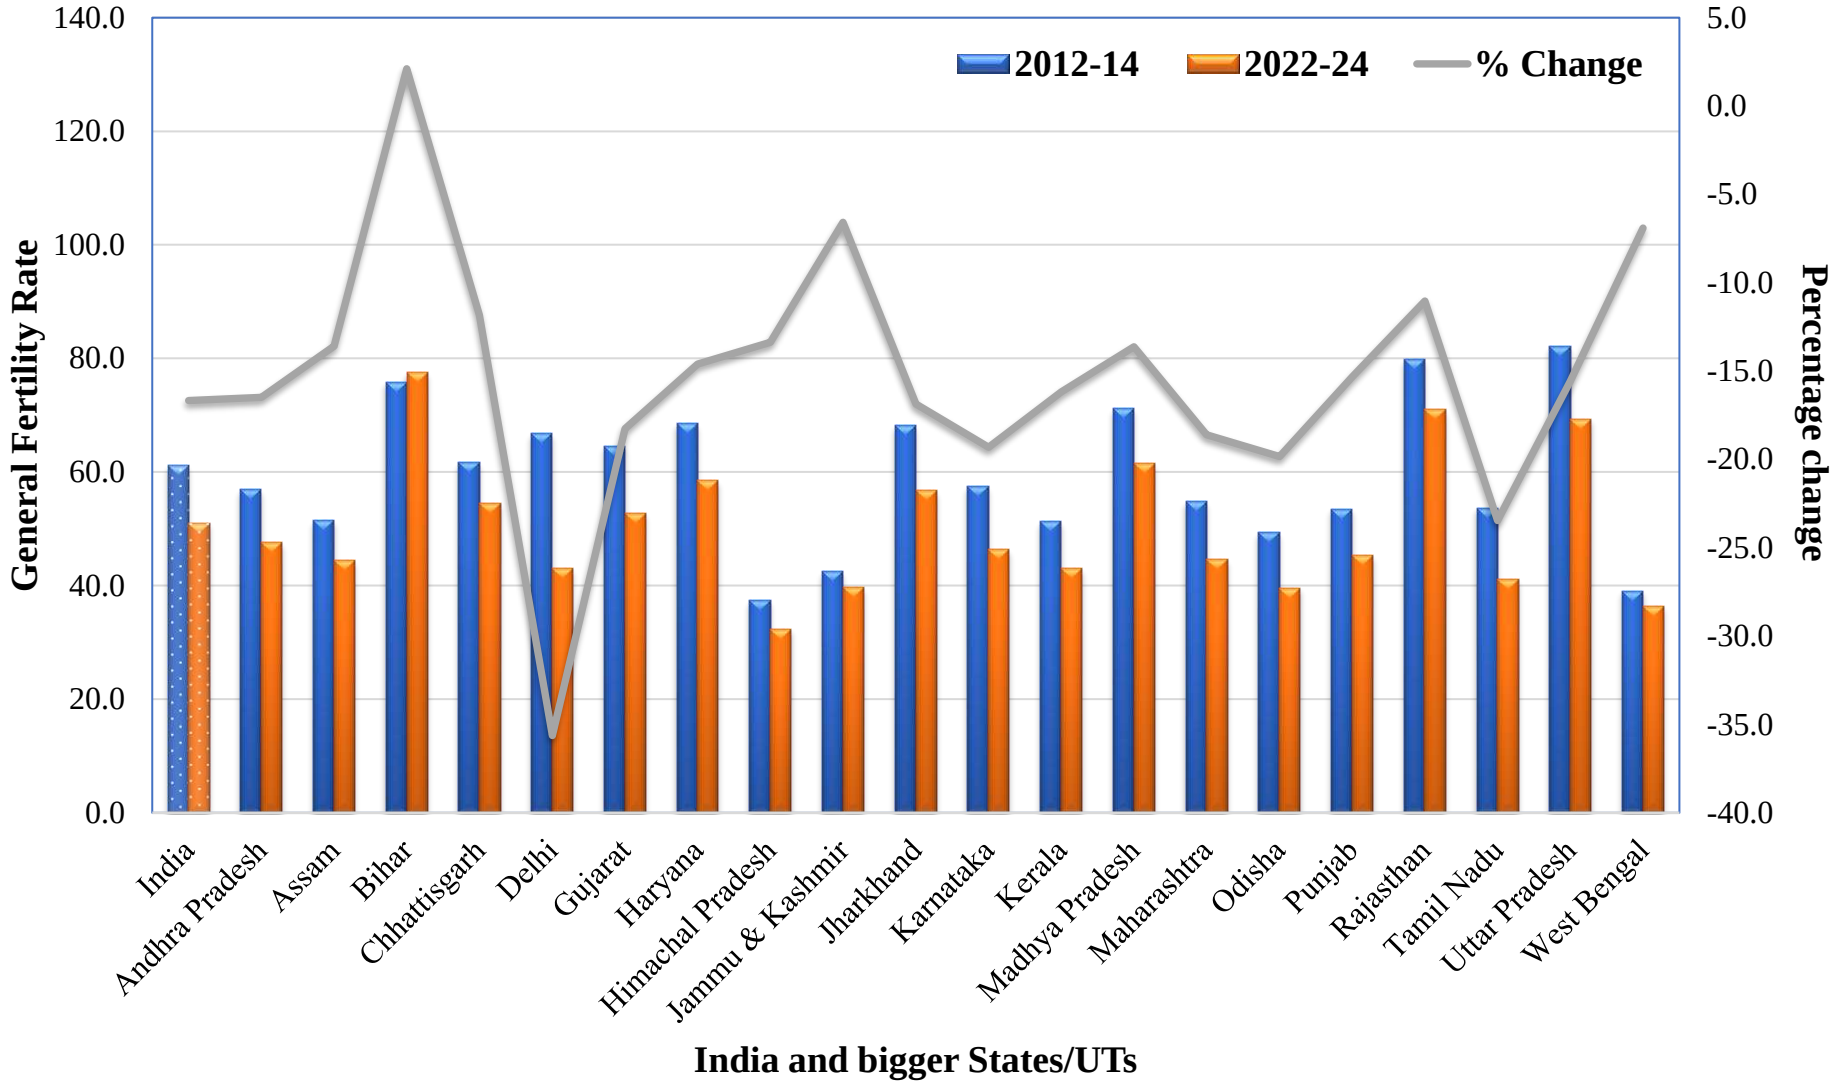

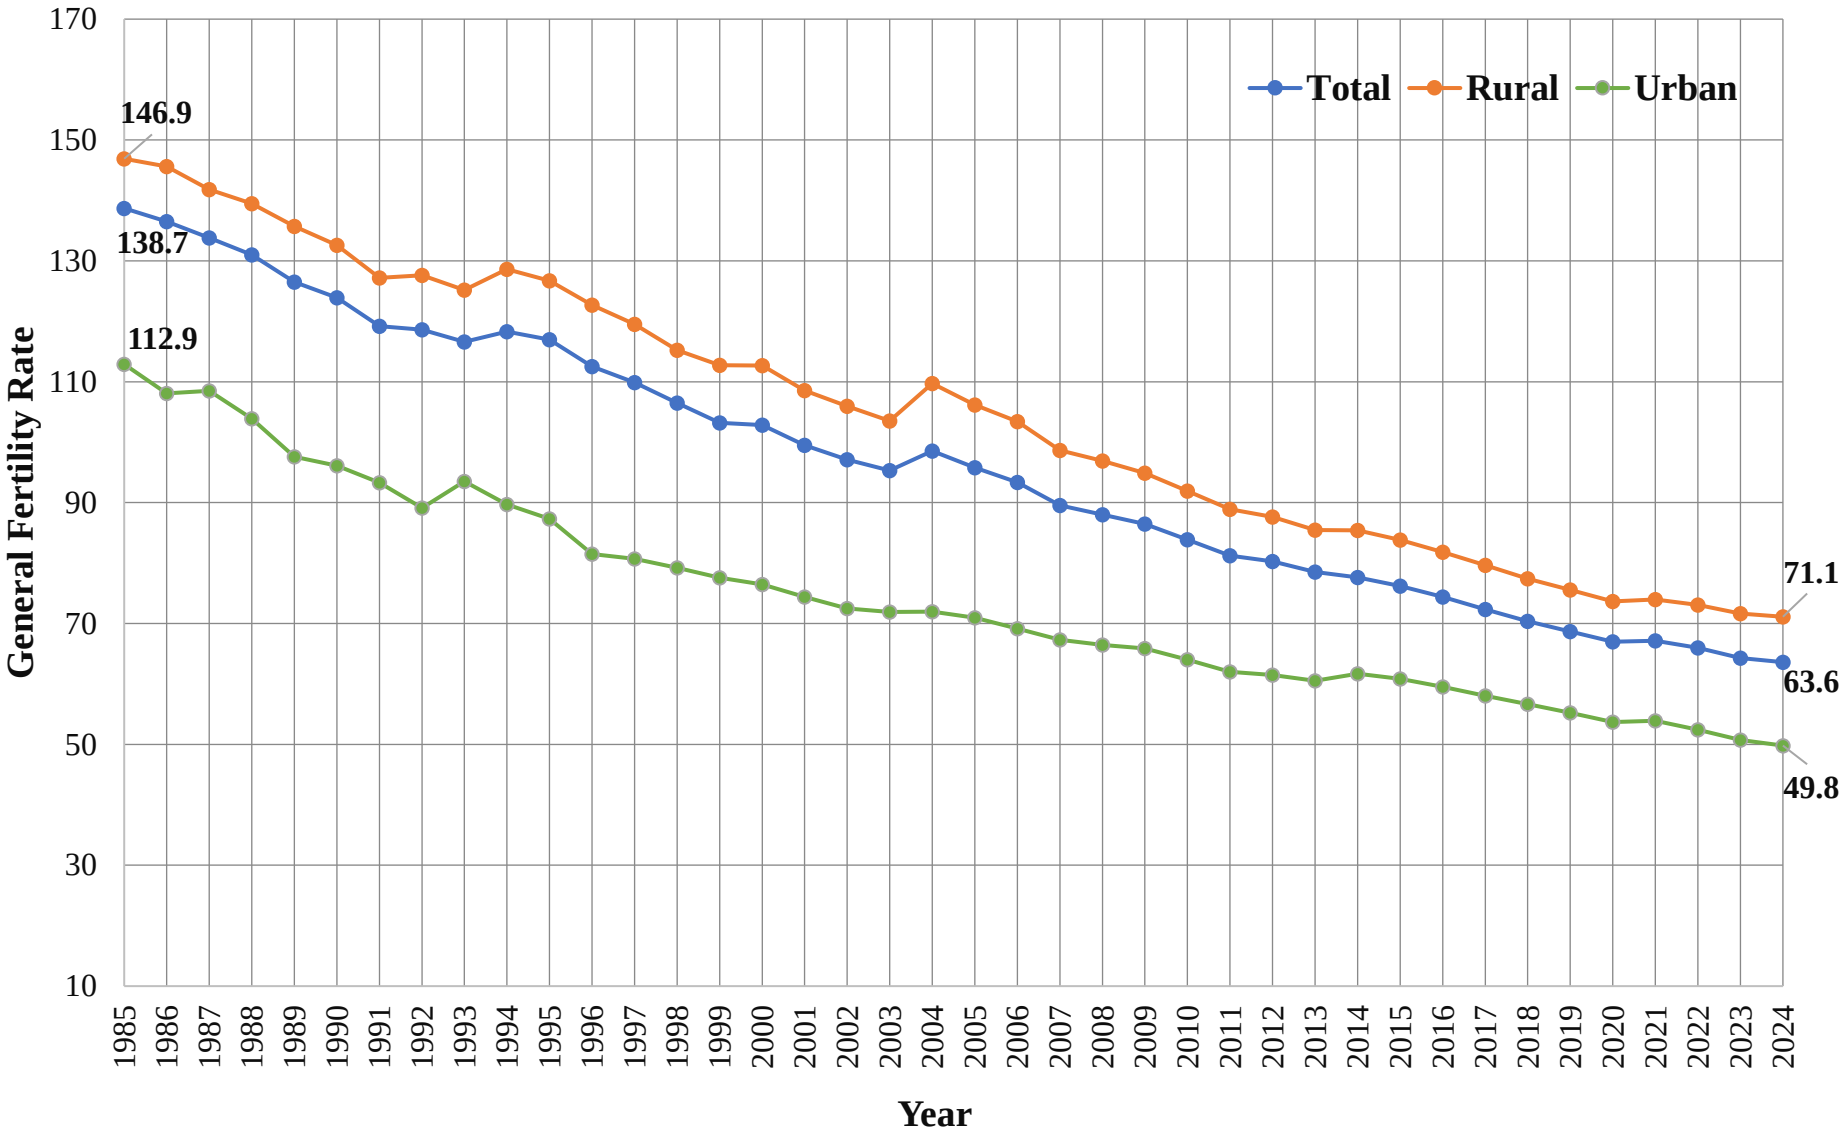

Chart 41: Trends in General Fertility Rate, 1985 - 2024 by Residence, India

Fertility by age of Women:

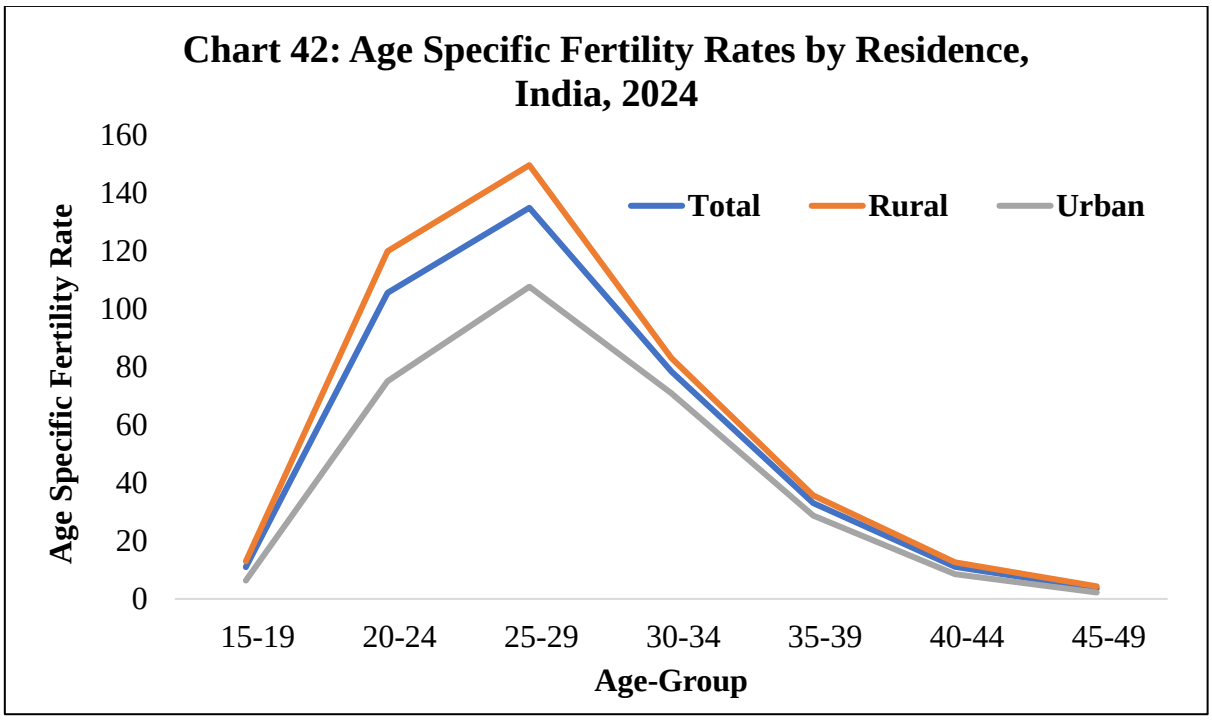

3.12 Age of women is an important factor affecting the fertility levels. On the basis of data on births to women by specific age-groups in the reproductive span 15-49 years as available from SRS, Age-Specific Fertility Rates have been calculated. Statement 19 below presents the Age-Specific Fertility Rates for India by residence for the year 2024.

3.13 The data reveals that fertility in all the age-groups was higher in rural areas than in urban areas in 2024 with the difference being more prominent in the younger age-groups. The highest ASFR was observed in the age-group 25-29, with a total rate of 134.7, rural rate of 149.4 and urban rate of 107.5. The ASFRs gradually decrease for higher age-groups, with the lowest rate of 3.5 observed in the age-group 45-49. This distribution of Age-Specific Fertility Rates by residence is presented in Chart 42. ASFR curve for urban areas falls under the ASFR curve of rural areas. Both rural and urban ASFR curves have declined very steeply after attaining a peak for age 25-29.

Statement 19

ASFRs (Age Specific Fertility Rates) by Residence, India, 2024

Age Groups	Total	Rural	Urban
15-19	10.9	13.0	6.3
20-24	105.5	119.8	75.0
25-29	134.7	149.4	107.5
30-34	78.3	83.0	70.8
35-39	33.0	35.6	28.7
40-44	11.0	12.6	8.5
45-49	3.5	4.3	2.2

3.14 The percentage change in Age-Specific Fertility Rate during the last decade is presented below in Statement 20 separately for rural and urban areas. The data pertains to changes in the Age-Specific Fertility Rates for the quinquennial age-groups based on average value for three years period viz. 2012-14 and 2022-24 for all-India.

3.15 At the National level, there is a shift in fertility trends, with an increase in fertility in the later ages 30-49 and a decrease in the lower age-groups 15-29. Charts 43, 44 and 45 depict the average Age-Specific Fertility Rates of India between 2012-14 and 2022-24 for Total, Rural and Urban areas respectively. Chart 46 shows the percentage change in average Age-Specific Fertility Rates between 2012-14 and 2022-24 by residence.

Statement 20

Percent change in Age-Specific Fertility Rates by Residence between 2012-14 and 2022-24, India

Age group	Total			Rural			Urban		
	2012-14	2022-24	% Change	2012-14	2022-24	% Change	2012-14	2022-24	% Change
15-19	29.0	11.0	-62.1	32.6	13.0	-60.1	17.9	6.4	-64.2

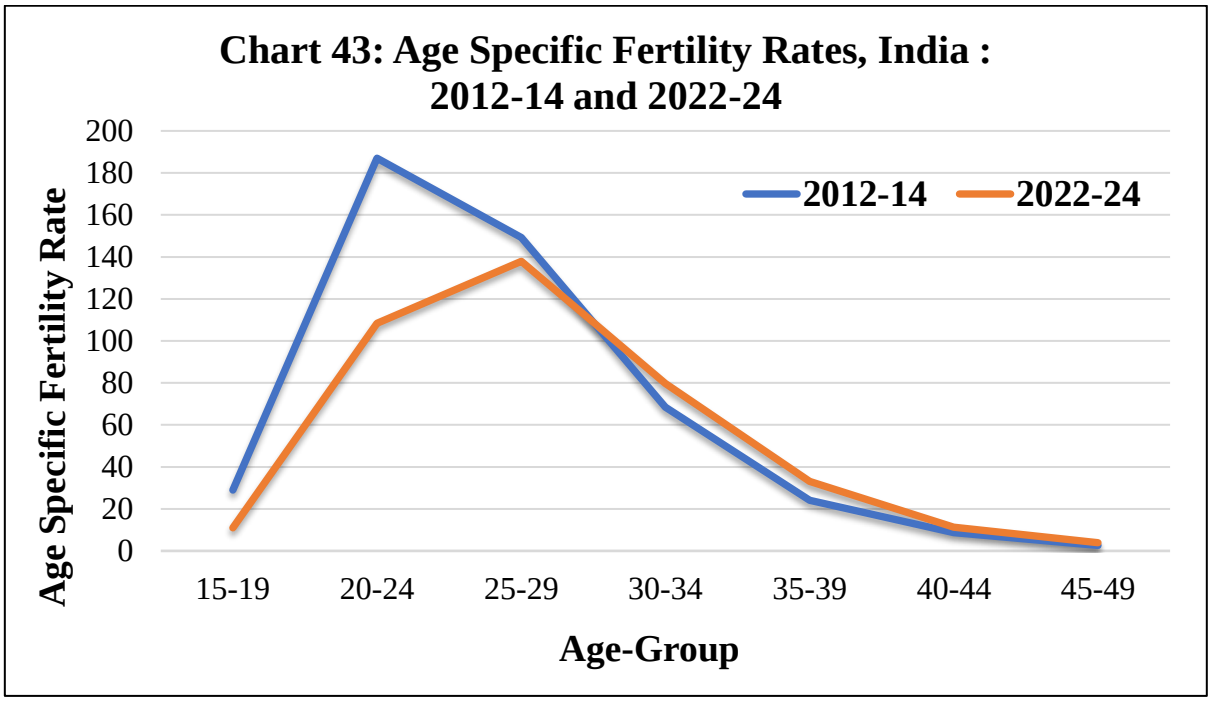

Chart 44: Age Specific Fertility Rates, India-Rural : 2012-14 and 2022-24

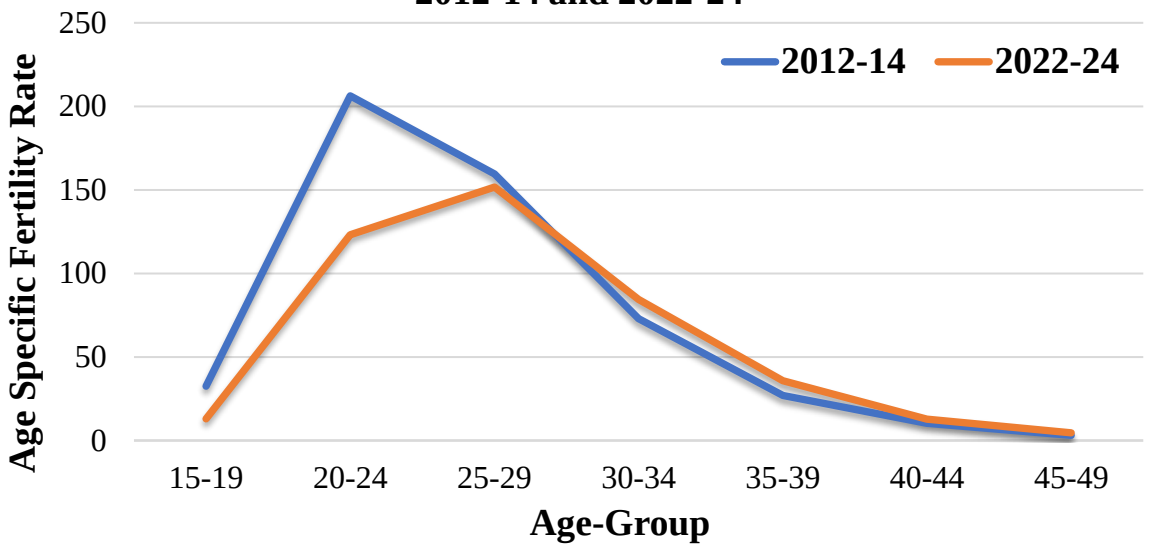

Chart 45: Age Specific Fertility Rates, India-Urban : 2012-14 and 2022-24

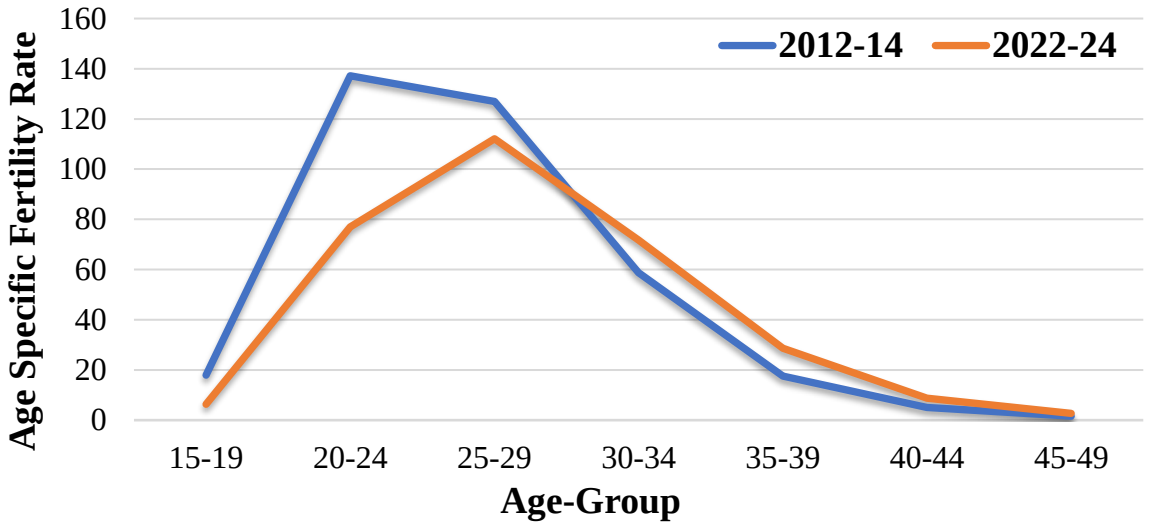

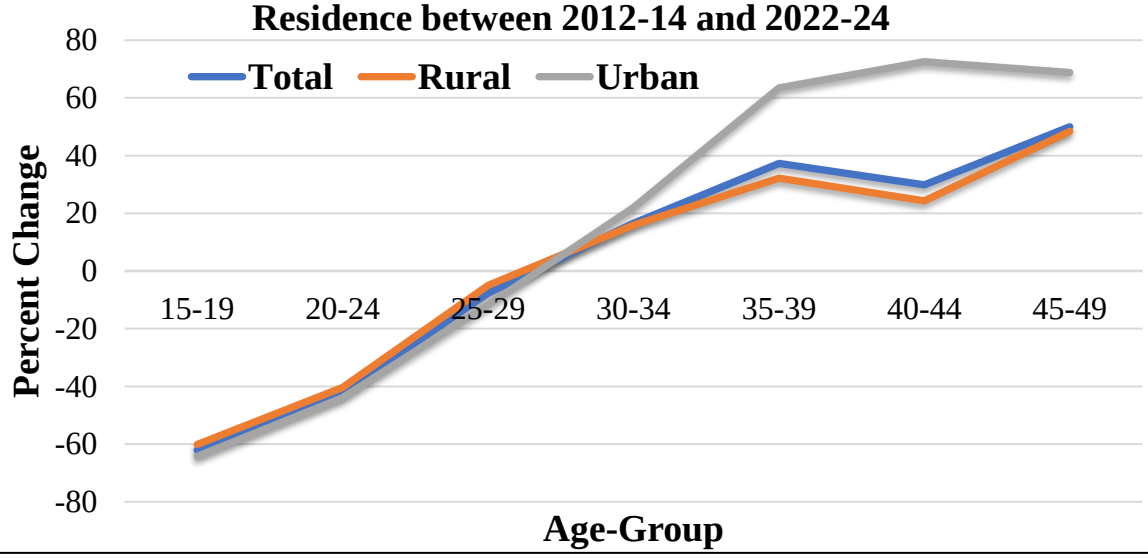

Chart 46: Percent change in Age Specific Fertility Rate by Residence between 2012-14 and 2022-24

Age-Specific Fertility Rate across Bigger States/UTs:

3.16 The fertility pattern by age-groups in different States/UTs in India for 2024 is presented below in Statement 21. The data shows that the highest fertility rate for India was for the age-group of 25-29 years with a value of 134.7 in 2024. This is followed by the age-group of 20-24 years having ASFR of 105.5. The data also indicates significant variations in fertility rates across bigger States/UTs. Bihar has the highest ASFR for the age-group of 25-29 years with a rate of 216, whereas the State of West Bengal had the lowest ASFR of 77.2 for the same age-group. The Age-Specific Fertility Rate peaks at the age-group 25-29 years for India and all States/UTs, except for West Bengal and Jammu & Kashmir, where it peaks at the age-group of 20-24 and 30-34 years respectively. Age-Specific Fertility Rate of age-group 15-19 years, which is also known as Adolescent Birth Rate (ABR) is an important indicator and is 10.9 at the National level for the year 2024. The State of West Bengal had the highest ASFR for 15-19 years or ABR of 22.9 followed by Assam (18.1) and Jharkhand (17.2), whereas NCT of Delhi (2.6) and Jammu & Kashmir (3.3) had the lowest ABR followed by Kerala (4.5) and Uttarakhand (4.6) respectively. The rural-urban levels in ASFR for bigger States/UTs are shown in Table 3.

Statement 21

ASFRs (Age Specific Fertility Rates), India and Bigger States/UTs, 2024

India and Bigger States/UTs	15-19	20-24	25-29	30-34	35-39	40-44	45-49
India	**10.9**	**105.5**	**134.7**	**78.3**	**33.0**	**11.0**	**3.5**

West Bengal	22.9	93.5	77.2	44.4	13.4	4.1	1.5

3.17 The percentage distribution of cumulative fertility by woman's age is shown below in Statement 22 for India and bigger States/UTs for the year 2024. However, there are some variations in the cumulative fertility rate among different States/UTs. West Bengal had the highest percentage of cumulative fertility rate for women aged 15-19, 15-24, and 15-34, Andhra Pradesh had the highest percentage of cumulative fertility rate for women in the age group 15-29 while Delhi had the lowest percentage of cumulative fertility rate for women aged 15-19 and Jammu & Kashmir had lowest percentage of cumulative fertility rate for women for higher age-groups. Chart 47 gives percentage cumulative Age-Specific Fertility Rate for India by residence. Chart 47A gives contribution of various age-groups in Total Fertility by Residence for India for the year 2024.

Statement 22

Percentage distribution of cumulative fertility by age-group, India and Bigger States/UTs, 2024

India and Bigger States/UTs	15-19	15-24	15-29	15-34	15-39	15-44	15-49

15-34	91.2	91.7	89.8
15-29	72.9	75.1	67.0
15-24	34.0	36.4	27.5
15-19	2.7	3.1	1.8

Mean Age of Fertility:

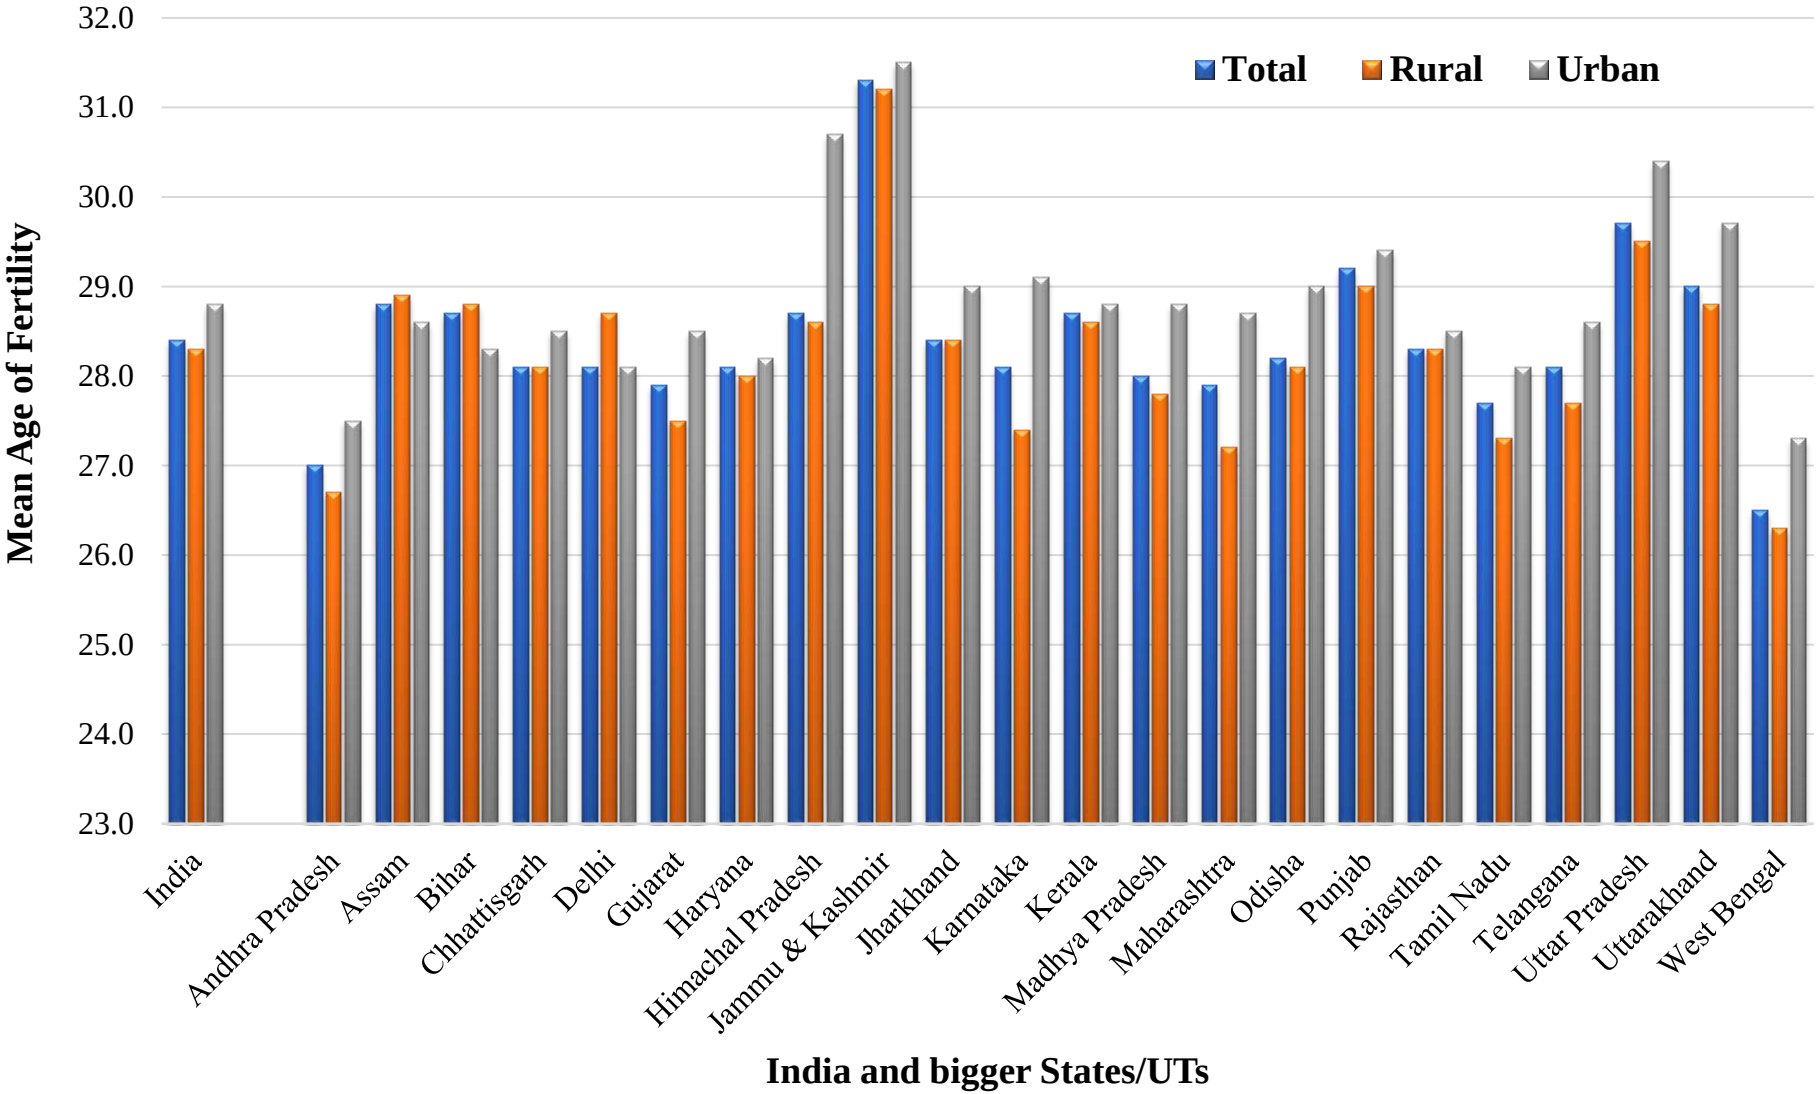

3.18 The difference in the pattern of child bearing can be assessed in terms of the Mean Age of Fertility, which describes the age pattern of fertility of synthetic cohort of hypothetical group of women viewed as having, in their lifetime, similar fertility experience recorded in a given year. The Mean Age of Fertility has been calculated from the Age-Specific Fertility Rate. The Mean Age of Fertility is the average age at which women give birth to their first child. The associated standard deviations are also shown. Statement 23 below shows the Mean Age of Fertility for India and bigger States/UTs in 2024. The Mean Age of Fertility for India was 28.4 years, ranging from 26.5 years in West Bengal to 31.3 years in Jammu & Kashmir. The Mean Age of Fertility is slightly higher in urban areas (28.8 years) compared to rural areas (28.3 years). Chart 48 shows the Mean Age of Fertility for India and bigger States/UTs by residence.

Statement 23

Chart 48: Mean Age of Fertility, India and Bigger States/UTs, 2024

Total Fertility Rate:

3.19 The cumulative value of the Age-Specific Fertility Rates at the end of the child bearing age gives a measure of fertility known as Total Fertility Rate (TFR). TFR indicates the average number of children expected to be born per woman during her entire span of reproductive period assuming that the Age-Specific Fertility Rates, to which she is exposed to, continue to be the same and that there is no mortality. The TFRs worked out on the basis of the ASFRs for the year 2024 are presented below in Statement 24 for India and bigger States/UTs separately for rural and urban areas. The TFR for India in 2024 was 1.9, with a higher TFR in rural areas (2.1) than in urban areas (1.5). Bihar had the highest TFR among the bigger States/UTs with 2.9, followed by Uttar Pradesh (2.6) and Madhya Pradesh & Rajasthan at 2.4 and 2.3 respectively. Delhi records the lowest TFR at 1.2, followed by Tamil Nadu ,Kerala and West Bengal at 1.3 each.Andhra Pradesh, Jammu & Kashmir, Maharashtra, and Punjab stands at 1.4, while Himachal Pradesh, Karnataka, , and Telangana each have a TFR of 1.5. The TFR in urban areas was generally lower than in rural areas across all major States/UTs in India, except for Kerala which shows higher in urban, and Tamil Nadu which remained constant for both the areas. Chart 49 presents levels of TFR by residence for India and bigger States/UTs. Distribution of bigger States/UTs by values of TFR in rural and urban areas is shown in Chart 50.

Statement 24

TFR (Total Fertility Rate) by Residence, India and Bigger States/UTs, 2024

India and Bigger States/UTs	Total	Rural	Urban
India	**1.9**	**2.1**	**1.5**
Andhra Pradesh	1.4	1.5	1.3
Assam	1.9	2.1	1.3
Bihar	2.9	3.0	2.3

Uttarakhand	1.7	1.8	1.5
West Bengal	1.3	1.4	1.1

Note: Rounded off to one decimal point.

Chart 49: Total Fertility Rate (TFR) by Residence, India and Bigger States/UTs, 2024

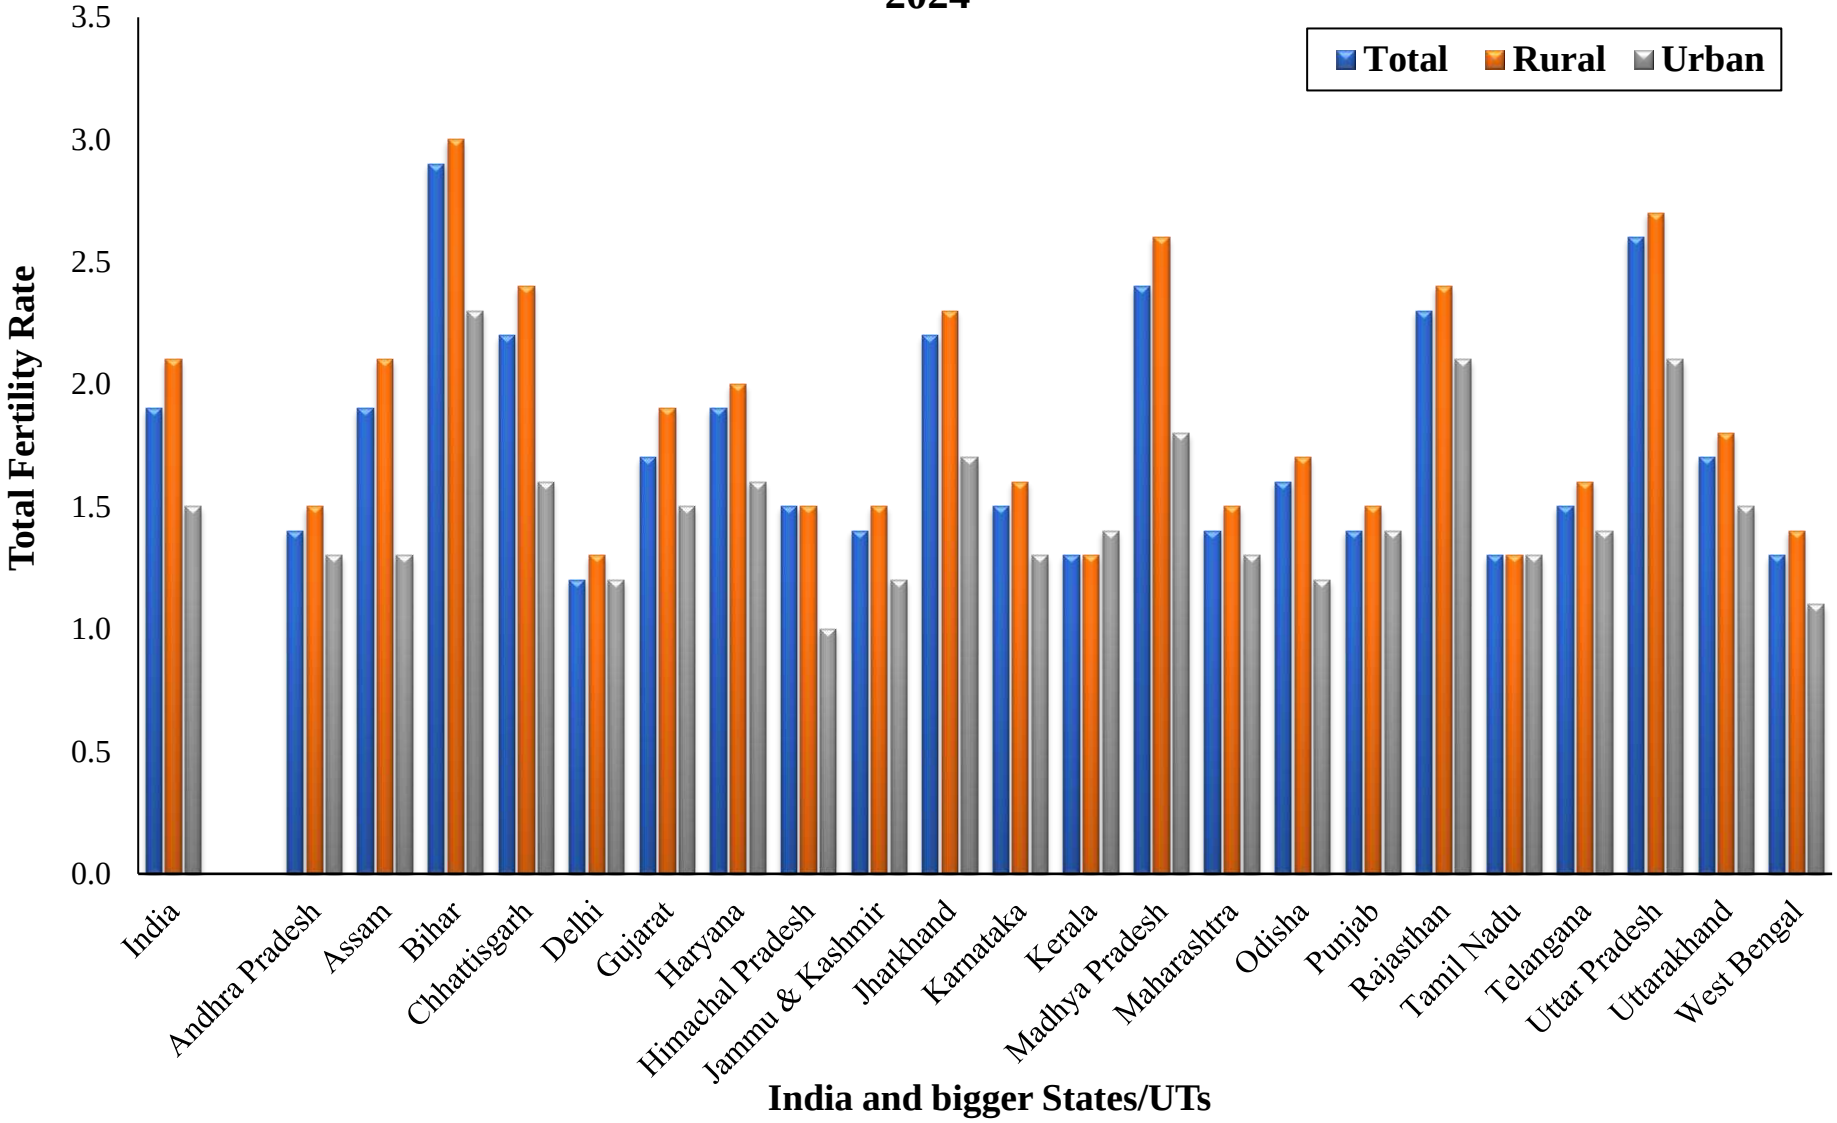

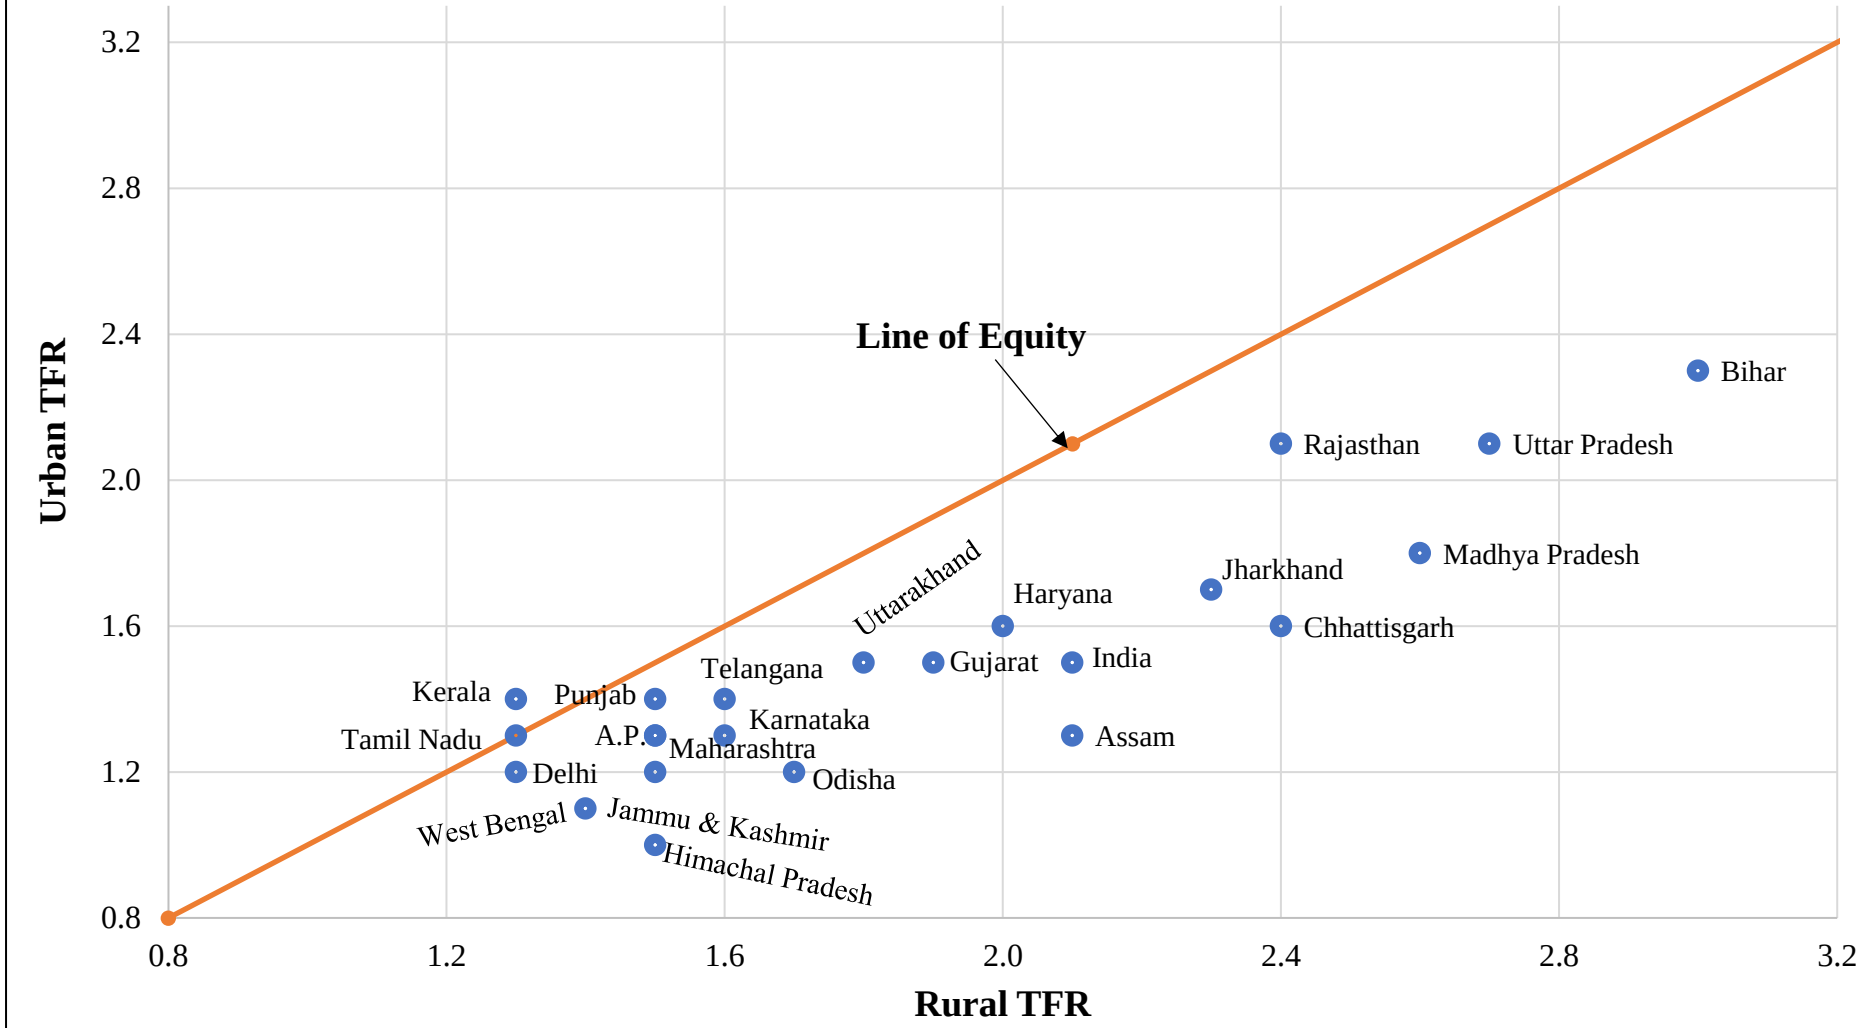

Chart 50: Distribution of bigger States/UTs by values of TFR for rural and urban areas, 2024

3.20 Statement 25 below presents the percentage change in the average level of TFR between the periods 2012-14 and 2022-24 in India and bigger States/UTs by residence. Overall average TFR in India has decreased from 2.3 in 2012-14 to 1.9 in 2022-24, which is a decrease of 17.4%. The rural TFR decreased by 19.2% (from 2.6 to 2.1), while the urban TFR decreased by 16.7% (from 1.8 to 1.5). Among the bigger States/UTs, Delhi had the highest percentage decrease in average TFR between 2012-14 and 2022-24 (29.4%), followed by Gujarat (25.0%) and Tamil Nadu (23.5%) respectively and lowest percentage decrease is observed in Bihar at 9.4% followed by Chhattisgarh (11.5%), Himachal Pradesh (11.8%), and Punjab (11.8%). Charts 51, 52 and 53 depict the average TFR and corresponding percent change between 2012-14 and 2022-24 for India and bigger States/UTs in terms of Total, Rural and Urban areas respectively. Chart 54 shows the trend in year-wise TFR from 1985 to 2024 by residence for India.

Statement 25

Percentage Change in Average TFR (Total Fertility Rate) between 2012-14 and 2022-24 by Residence, India and Bigger States/UTs

India and Bigger States/UTs	Total			Rural			Urban

Gross Reproduction Rate:

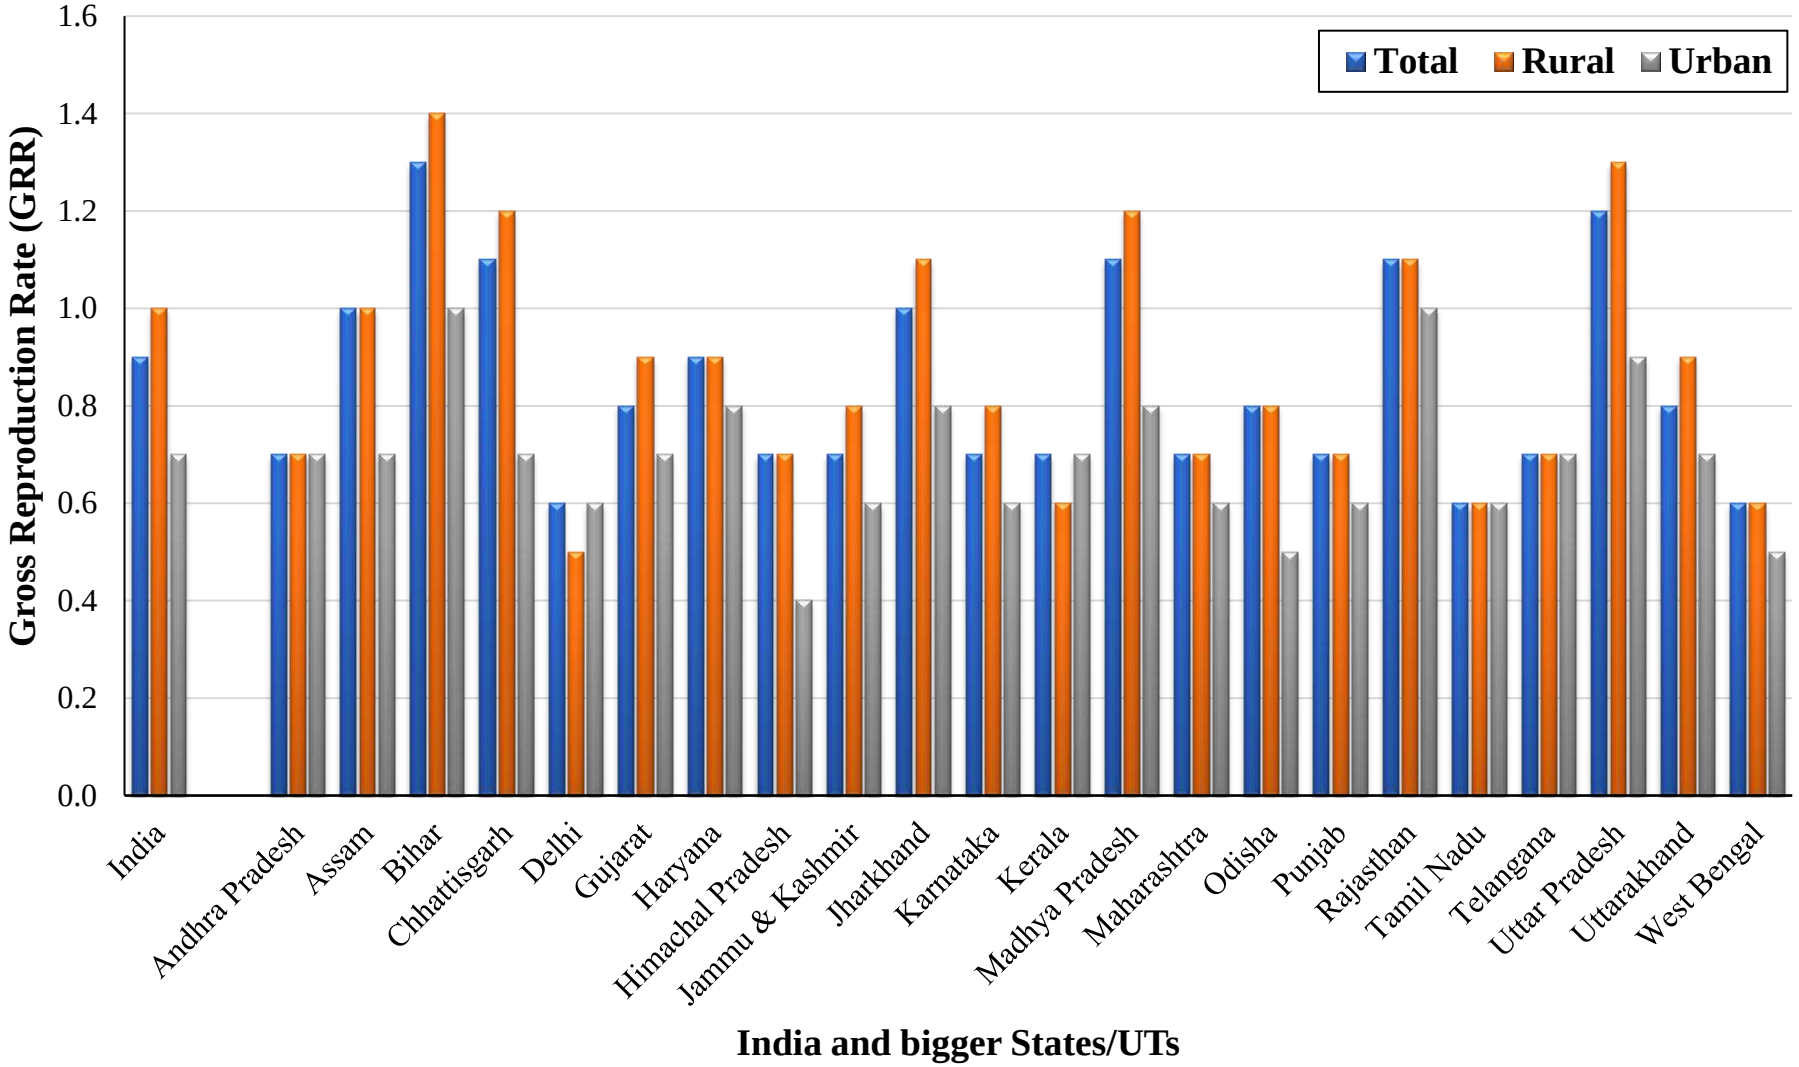

3.21 Another refined measure of fertility that accounts for future mothers is the Gross Reproduction Rate (GRR). It measures the average number of female children a woman is expected to give birth during her entire reproductive span conforming to the Age-Specific Fertility Rates (ASFRs) for a given year, if there is no mortality. The estimated value of GRR for India in 2024 stands at 0.9, and varies from 0.7 in urban areas to 1.0 in rural areas. The GRR values for the major States/UTs range from 0.6 in Delhi, Tamil Nadu and West Bengal to 1.3 in Bihar. Most of the States/UTs had lower GRR values for their urban populations compared to their rural populations except for Delhi and Kerala meanwhile GRR for Andhra Pradesh, Tamil Nadu, and Telangana remained same for both rural and urban. Statement 26 provides the GRR by Residence for India and Bigger States/UTs and the same is represented in Chart 55.

Statement 26

GRR (Gross Reproduction Rate) by Residence, India and Bigger States/UTs, 2024

India and Bigger States/UTs	Total	Rural	Urban
India	**0.9**	**1.0**	**0.7**
Andhra Pradesh	0.7	0.7	0.7

Chart 55: Gross Reproduction Rate (GRR) by Residence, India and Bigger States/UTs, 2024

Marital Fertility:

3.22 Marriage is an important event in the social life of any population. In India, population census and large-scale demographic sample surveys invariably collects data on the marital status of population separately for males and females. Age at effective marriage of females is a key factor that influences fertility. Marital distribution of the population enumerated through SRS and the age at effective marriage of females has been discussed in Chapter 2. Based on the distribution of live births by age of married females, Age-Specific Marital Fertility Rates (ASMFRs) are calculated. Statement 27 below provides the estimates of the ASMFRs for India separately for rural and urban areas for the year 2024. The highest Age-Specific Marital Fertility Rates are for women in the 15-19 age-group, with a total rate of 321.0 births per 1000 married women, and slightly higher rates for rural areas compared to urban areas. Fertility rates then decreases with increasing age, with the lowest rates for women in the 45-49 age-group. Chart 56 depicts ASMFRs by residence for India in 2024.

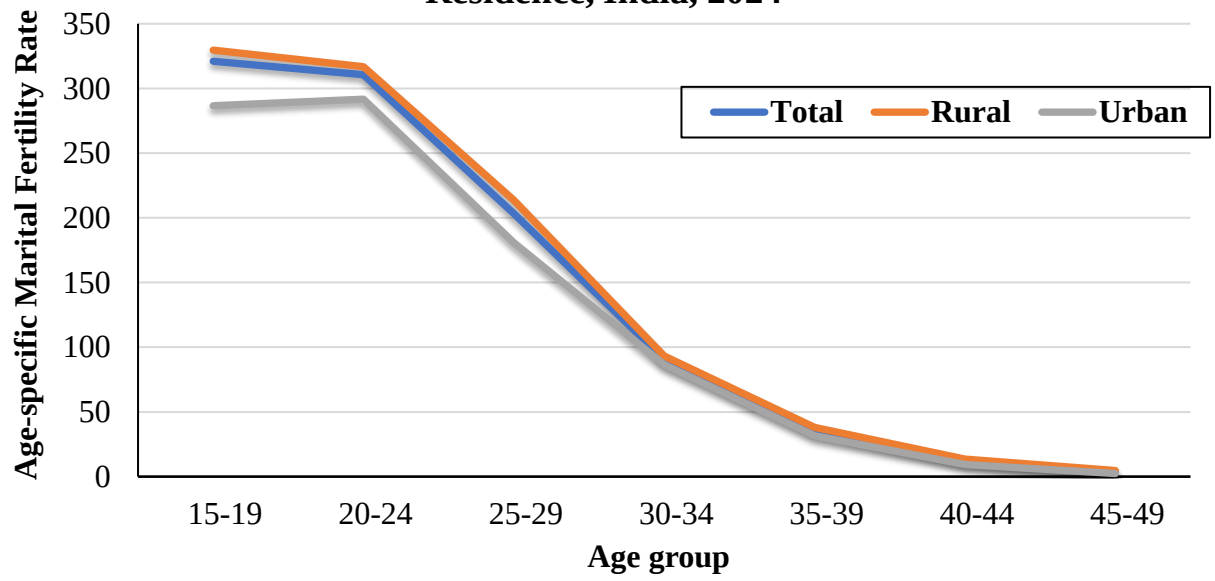

Statement 27

ASMFRs (Age-Specific Marital Fertility Rates) by Residence, India, 2024

(Per thousand)

Age group	Total	Rural	Urban
15-19	321.0	329.6	286.7
20-24	310.7	316.7	291.7
25-29	203.3	213.7	180.7
30-34	90.7	93.2	86.5
35-39	35.5	37.9	31.6
40-44	11.9	13.5	9.3
45-49	3.9	4.7	2.4

Chart 56: Age specific Marital Fertility Rates (ASMFRs) by Residence, India, 2024

3.23 Values of the Age-Specific Marital Fertility Rates (ASMFR) for the year 2024 in bigger States/UTs are given below in Statement 28. Age-Specific Marital Fertility Rate is at peak level in the age-group 15-19 at the National level and the majority of bigger States/UTs; however, for the States/UTs of Andhra Pradesh, Bihar, Chhattisgarh, Haryana, Jammu & Kashmir, Madhya Pradesh, Maharashtra, Odisha, Punjab, Rajasthan, Tamil Nadu, and Telangana, the ASMFR is at peak level in the age-group 20-24. There is a significant decline in marital fertility for women aged 30 years onwards, for all bigger States/UTs.

Statement 28

ASMFRs (Age-Specific Marital Fertility Rates), India and Bigger States/UTs, 2024

India and Bigger States/UTs	15-19	20-24	25-29	30-34	35-39	40-44	45-49

Total Marital Fertility Rate:

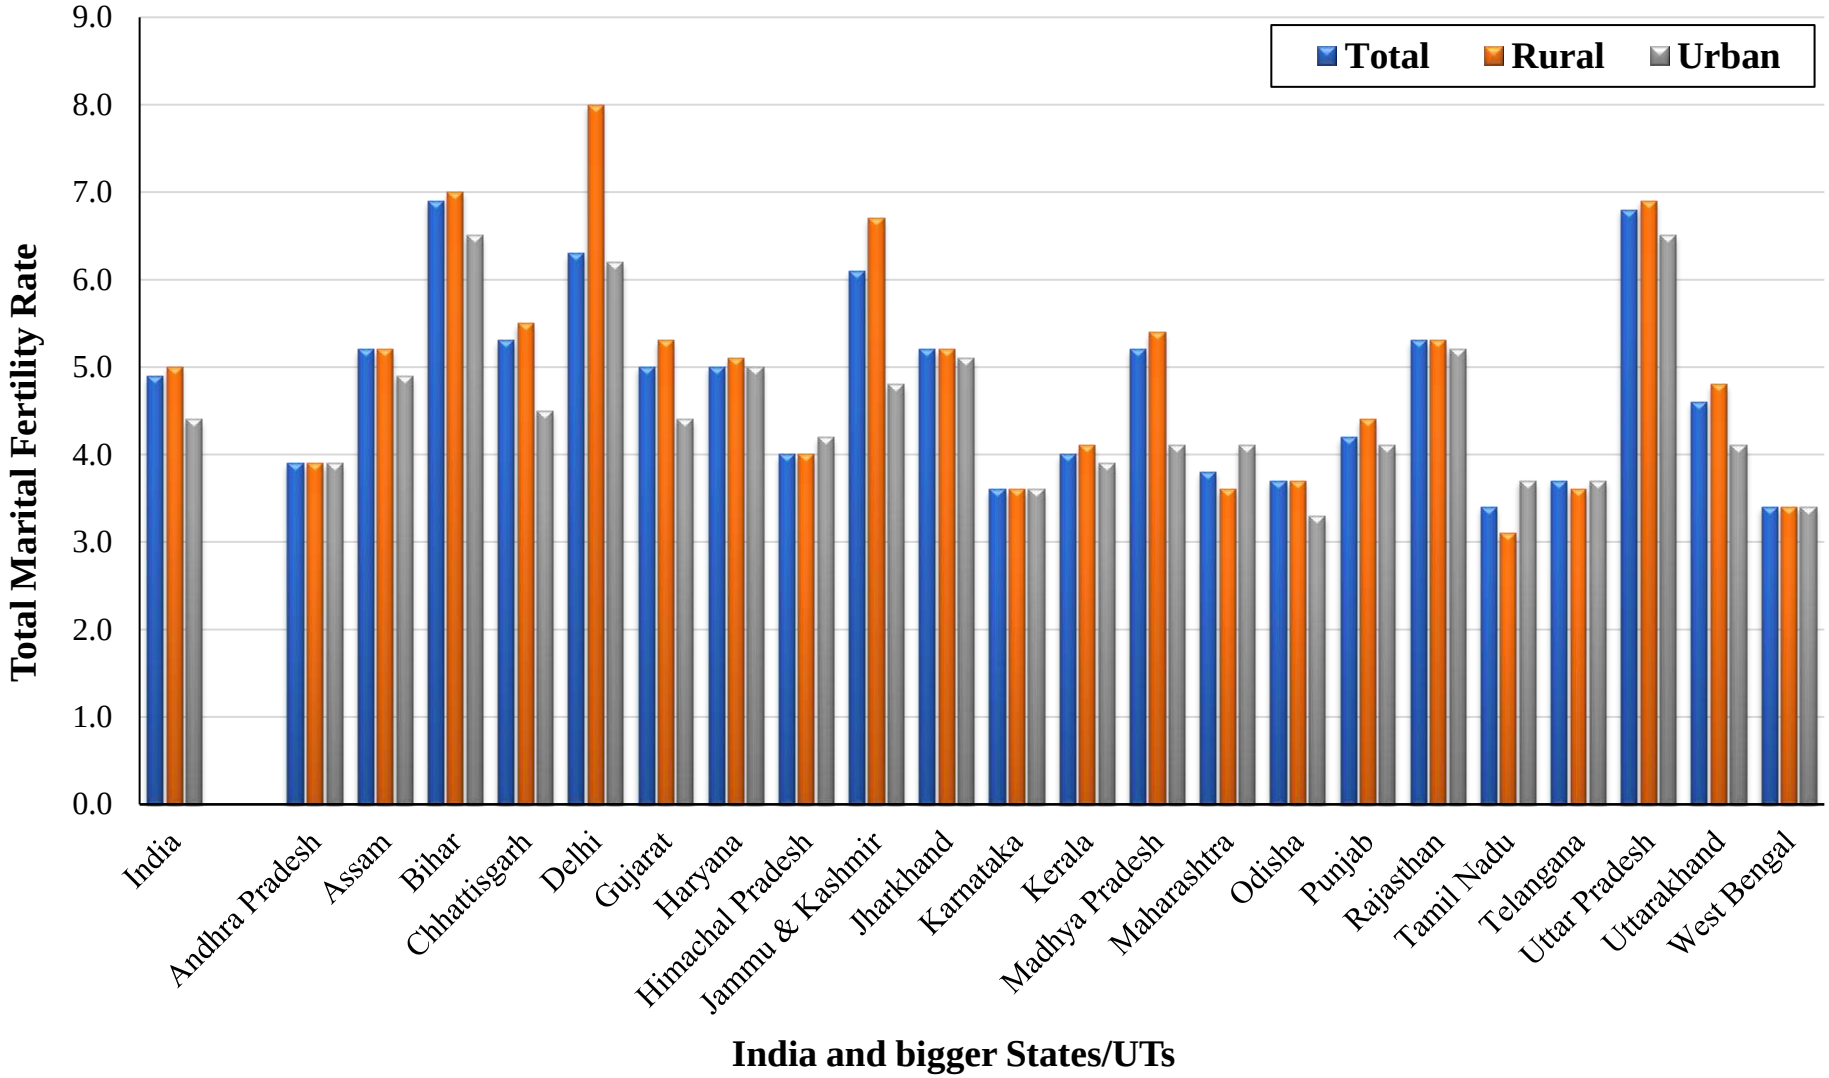

3.24 Like TFR, Total Marital Fertility Rate (TMFR) is the cumulative value of Age-Specific Marital Fertility Rates at the end of the reproductive period. It indicates the average number of children expected to be born per married woman during the entire span of her reproductive period, if the ASMFRs continue to be the same and if there is no mortality. The TMFRs worked out on the basis of ASMFRs for the year 2024 are given below in Statement 29 for India and bigger States/UTs separately for rural and urban areas. The TMFR for India in 2024 was 4.9, with a higher TMFR in rural areas (5.0) compared to urban areas (4.4). The TMFRs for the individual States/UTs vary, with the highest TMFR being observed in Bihar (6.9), while the lowest TMFR is seen in Tamil Nadu and West Bengal each at 3.4 followed by Karnataka (3.6), Odisha & Telangana each at 3.7. The data also shows that the TMFR tends to be higher in rural areas compared to urban areas across most of the States/UTs. Chart 57 presents the TMFRs by residence for India and bigger States/UTs.

Statement 29

TMFRs (Total Marital Fertility Rates) by Residence, India and Bigger States/UTs, 2024

India and Bigger States/UTs	Total	Rural	Urban
India	**4.9**	**5.0**	**4.4**

Chart 57: Total Marital Fertility Rate (TMFRs) by residence, India and bigger States/UTs, 2024

3.25 Statement 30 below presents the percentage change in the average level of TMFR between the period 2012-14 and 2022-24 in India and bigger States/UTs. The data reveals that there has been an increase in the TMFR at National level and for most of the States/UTs. The TMFR for India has increased from 4.2 in 2012-14 to 5.0 in 2022-24, which is 19.0% increase. The rural TMFR increased by 15.9% from 4.4 to 5.1, while the urban TMFR increased by 15.4% from 3.9 to 4.5. Charts 58, 59 and 60 depict the average TMFR and corresponding rate of change between 2012-14 and 2022-24 for India and bigger States/UTs for Total, Rural, and Urban areas respectively.

Statement 30

Percentage Change in Average Total Marital Fertility Rate (TMFR) between 2012-14 and 2022-24 by Residence, India and Bigger States/UTs

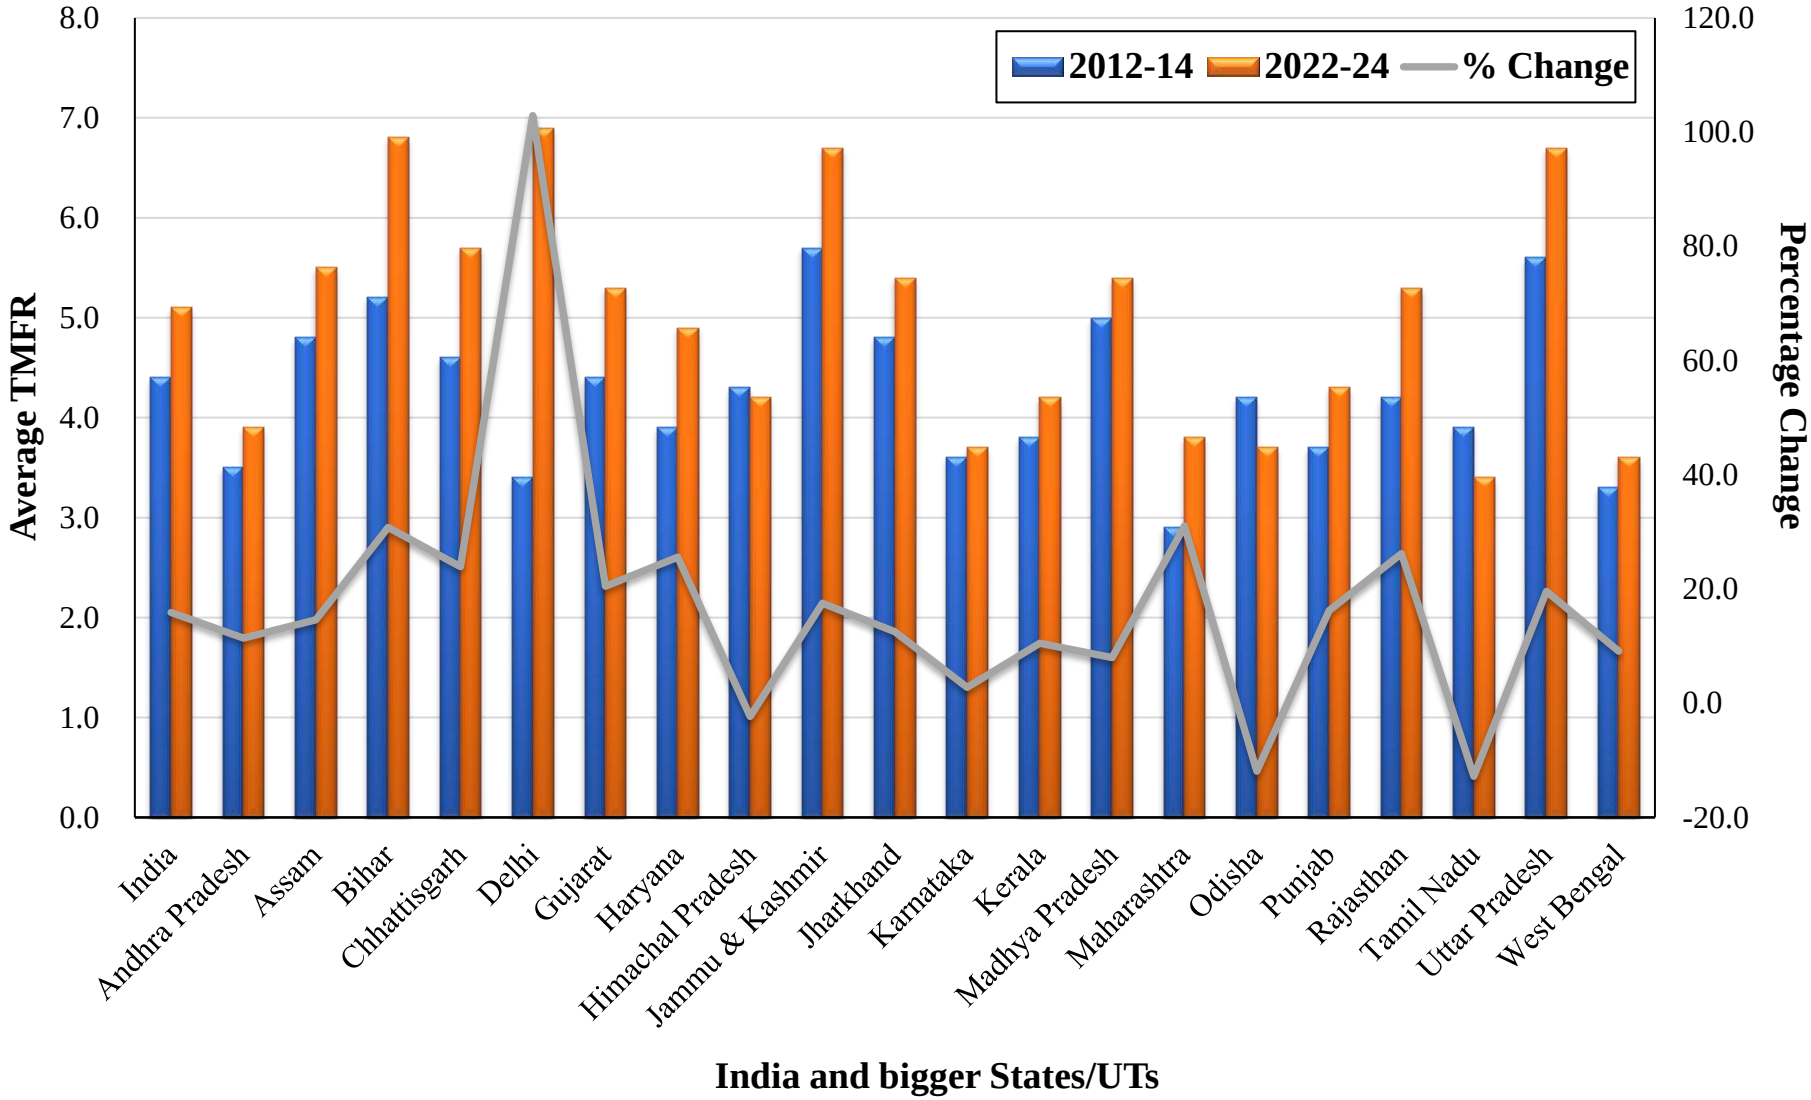

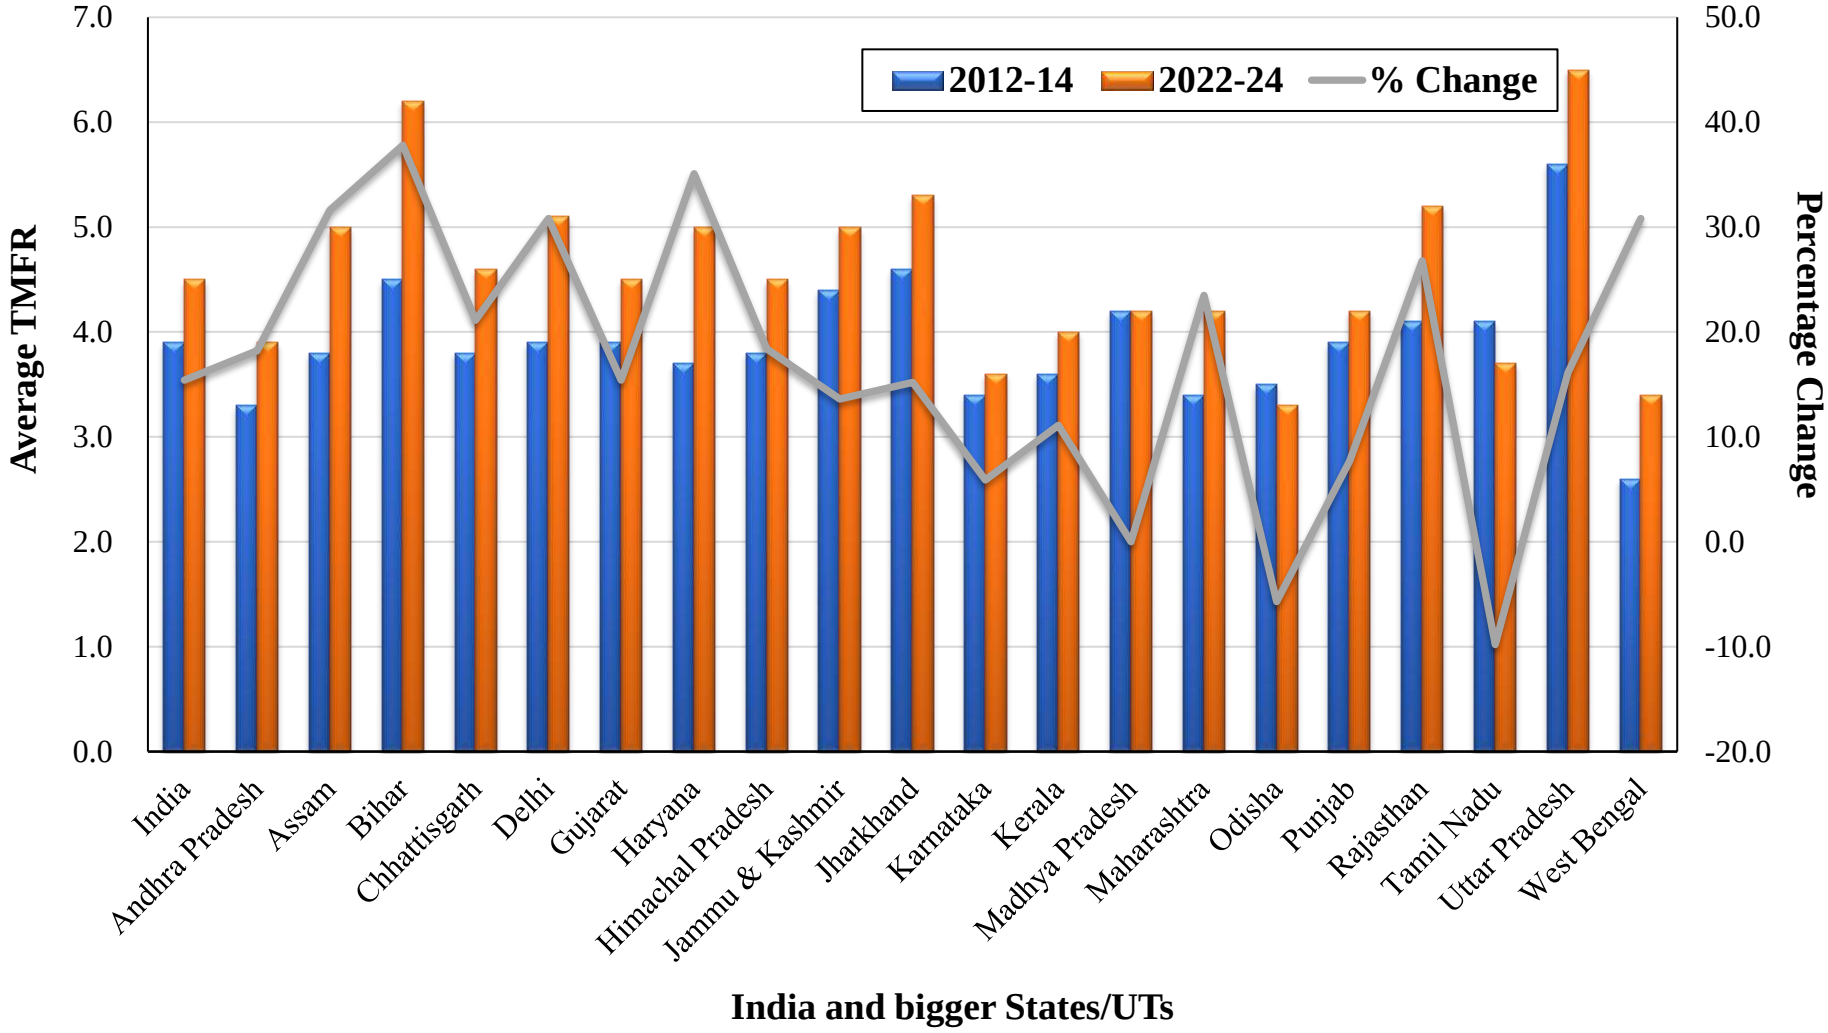

Chart 60: Average Total Marital Fertility Rate (TMFR) between 2012-14 & 2022-24, India and Bigger States/UTs - URBAN

Fertility by Level of Education of the Women:

3.26 Education, more precisely female education, has a direct impact on fertility. To ascertain levels of fertility by the educational status of the women, three indicators viz. General Fertility Rate, Age-Specific Fertility Rate and Total Fertility Rate by the educational status of the women have been worked out separately for rural and urban areas. These are discussed in the subsequent paragraphs.

3.27 Statement 31 below indicates the percentage of female population in the age-group 15-49 by the level of education, at the National level and for the bigger States/UTs in 2024. In 2024, in India, 8.9% of women in the age-group 15-49 were illiterate, while 91.1% were literate. Among literate women, 3.1% had no formal education, 7.7% had education level of below primary, 13.9% had primary education, 19.7% had middle school education, 19.3% had education till Class X, 15.2% Women have education till class XII and 12.1% had a graduate degree or above. Looking at the data for individual States/UTs, it can be seen that the percentage of illiterate women varies widely, from a low of 0.4% in Kerala to a high of 17.8% in Bihar. Similarly, the percentage of women with graduate and above education ranges from a low of 3.5% in Bihar to a high of 30.9% in Kerala.

Statement 31

3.28 Statement 32 below presents the estimates of General Fertility Rate (GFR) by educational status of the women for India and bigger States/UTs in 2024. Looking at the different States/UTs, Bihar had the highest GFR majorly across all levels of education, with illiterate women having a GFR of 102.4. Among the total literate women, Kerala had the lowest GFR of 40.3 whereas Tamil Nadu has lowest GFR for illiterate women at 14.1.

Statement 32

General Fertility Rate by Level of Education of Women, India and Bigger States/UTs, 2024

3.29 Statement 33 below presents, at the National level, Age-Specific Fertility Rates by level of education of women separately for rural and urban areas. The data shows that the Age-Specific Fertility Rate is highest in the 20-24 age group for Illiterate and women without formal education. For all other groups of women with different levels of education, the Age-Specific Fertility Rate is highest in 25-29 age-group. The Age-Specific Fertility Rate is highest for illiterate women and decreases with an increase in the level of education. The rate was higher in rural areas than in urban areas for almost all age groups and education levels. Chart 61, 62, and 63 depict the Age-Specific Fertility Rate by level of education of women for Total, Rural, and Urban areas respectively.

Statement 33

3.30 Total Fertility Rates by education levels of the women for India and bigger States/UTs for 2024 are presented below in Statement 34. For India, the TFR was 3.2 for illiterate women and 1.8 for literate women in 2024. Among literate women, those without any formal education had the TFR at 2.1, followed by those with below primary education (2.1), primary education (2.0), middle education (1.9), class X (1.8), class XII (1.7), and graduate and above (1.6). The TFR classified by education levels also varies across different States/UTs of India. Among the bigger States/UTs, Bihar had highest TFR among illiterate women (4.2), as well as for literate women (2.8). On the other hand, Kerala (0.8) and Himachal Pradesh (1.2) had the lowest TFR for illiterate women and Delhi has lowest TFR for literate women at 1.2. Chart 64 presents, at the National level, Total Fertility Rate by level of education of women separately for rural and urban areas for the year 2024. The TFR by levels of education of the women for India and bigger States/UTs by place of residence are given in Table-4.

Statement 34

Total Fertility Rate by Level of Education of Women, India and Bigger States/UTs, 2024

Chart 64: Total Fertility Rate by level of education of women, India, 2024

Birth Order:

3.31 Information on order of the live birth and interval between current and previous live births are also collected in SRS from 1990 onwards. These provide useful information on spacing of children and level of fertility. The estimated percentages on order of live birth and birth interval for India and bigger States/UTs are given in Tables 5, 6, and 7. Based on these tables, State-wise comparative Statements are presented below.

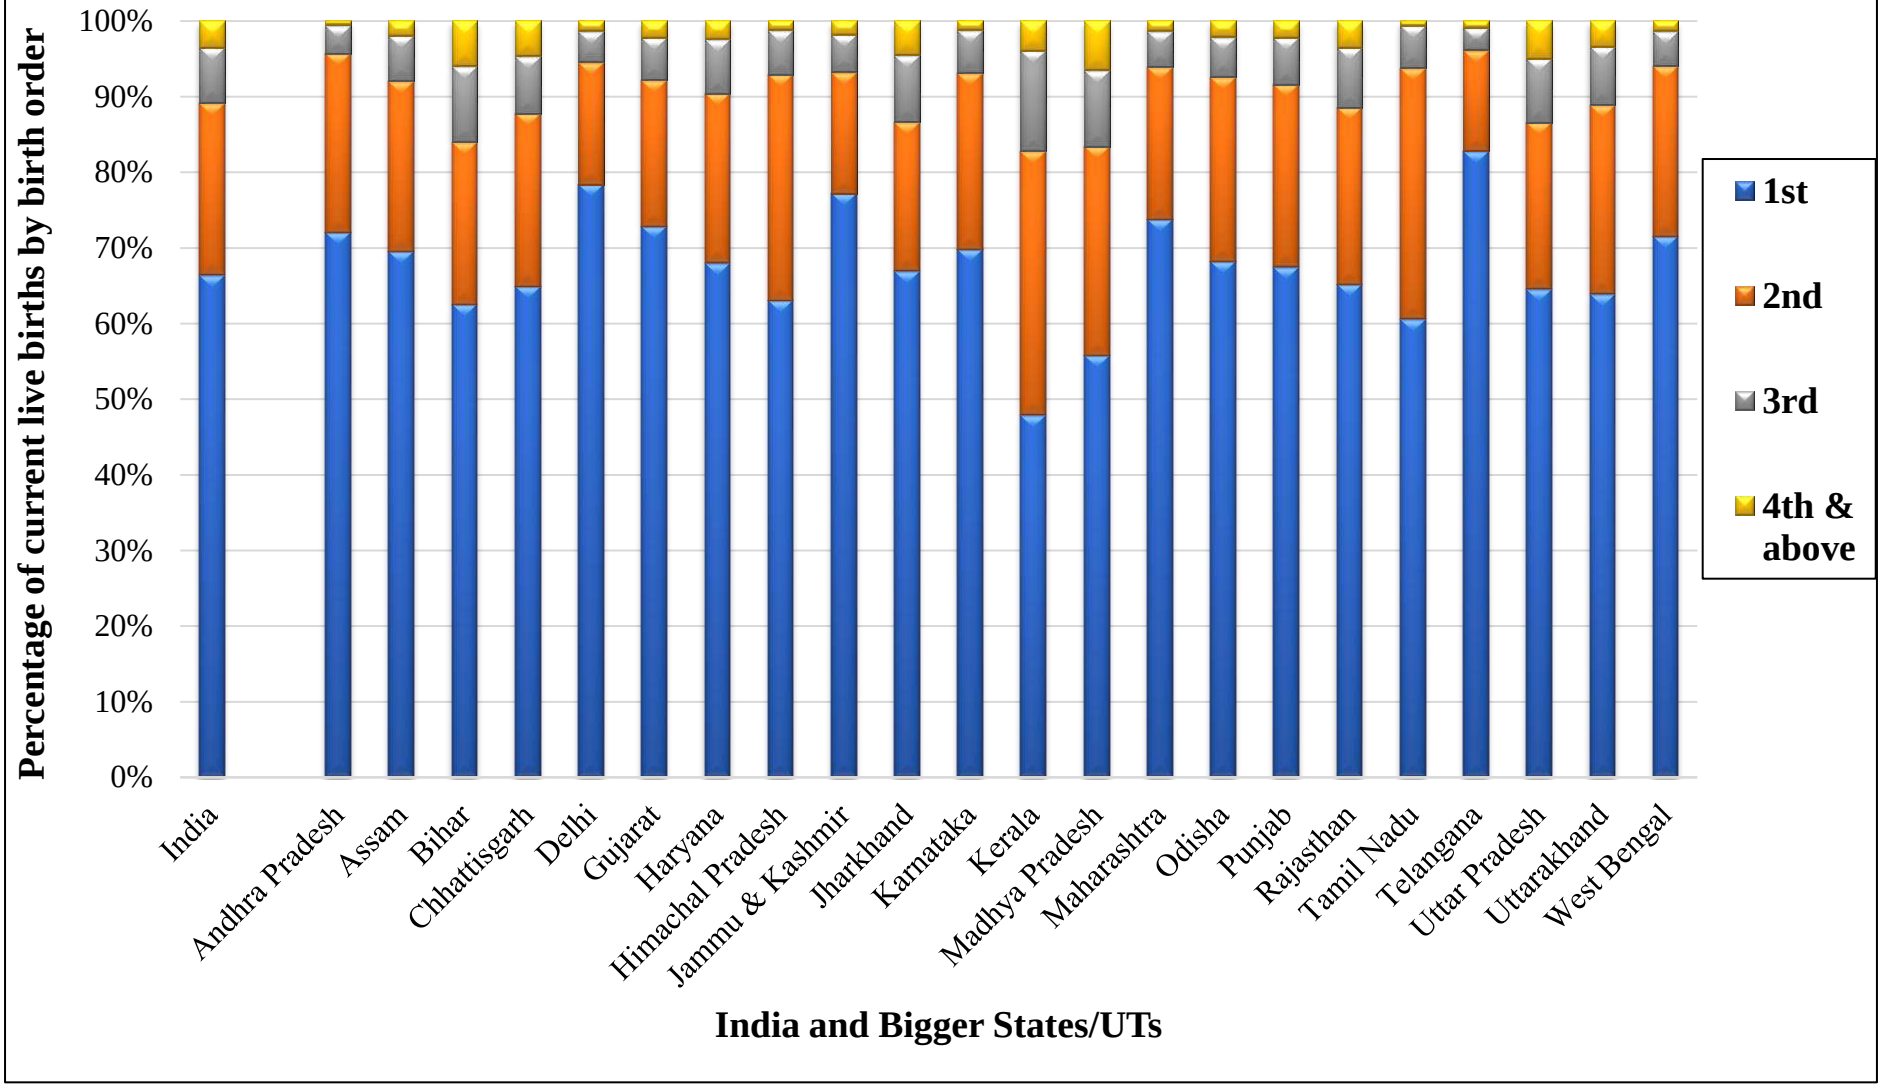

3.32 The percentage distribution of live births by birth order for India and bigger States/UTs for the year 2024 is presented below in Statement 35. As per 2024 data, in India, 66.4% of current live births are first-order births, 22.7% are second-order births, 7.3% are third-order births and 3.5% are fourth or higher-order births. As per 2024 data, among the bigger States/UTs, Telangana has the highest percentage of first-order births at 82.7%, while Kerala has the lowest at 47.9%. Kerala has the highest percentage of second-order births at 34.9%, while Telangana has the lowest at 13.4%. Kerala has the highest percentage of third-order births at 13.3%, while Telangana has the lowest at 2.9%. Madhya Pradesh has the highest percentage of fourth or higher-order births at 6.5%, while Andhra Pradesh has the lowest at 0.5%. Chart 65 shows the percentage distribution of current live births by birth order for India and bigger States/UTs.

Chart 65: Percentage distribution of current live births by Birth Order, India and Bigger States/UTs, 2024

3.33 Statement 36 below presents the percentage distribution of current live births by birth order and residence for India and bigger States/UTs. For India, 65.4% of live births were first order and 22.8% were second order, while 7.7% were third order and 4.0% were fourth or higher order in rural areas. In urban areas, 69.0% of live births were first order and 22.5% were second order, while 6.2% were third order and 2.3% were fourth or higher order. Among the bigger States/UTs, the percentage distribution of live births by birth order and residence is varied. Charts 66 and 67 depict the percentage distribution of current live births by birth order for rural and urban areas respectively.

Statement 36

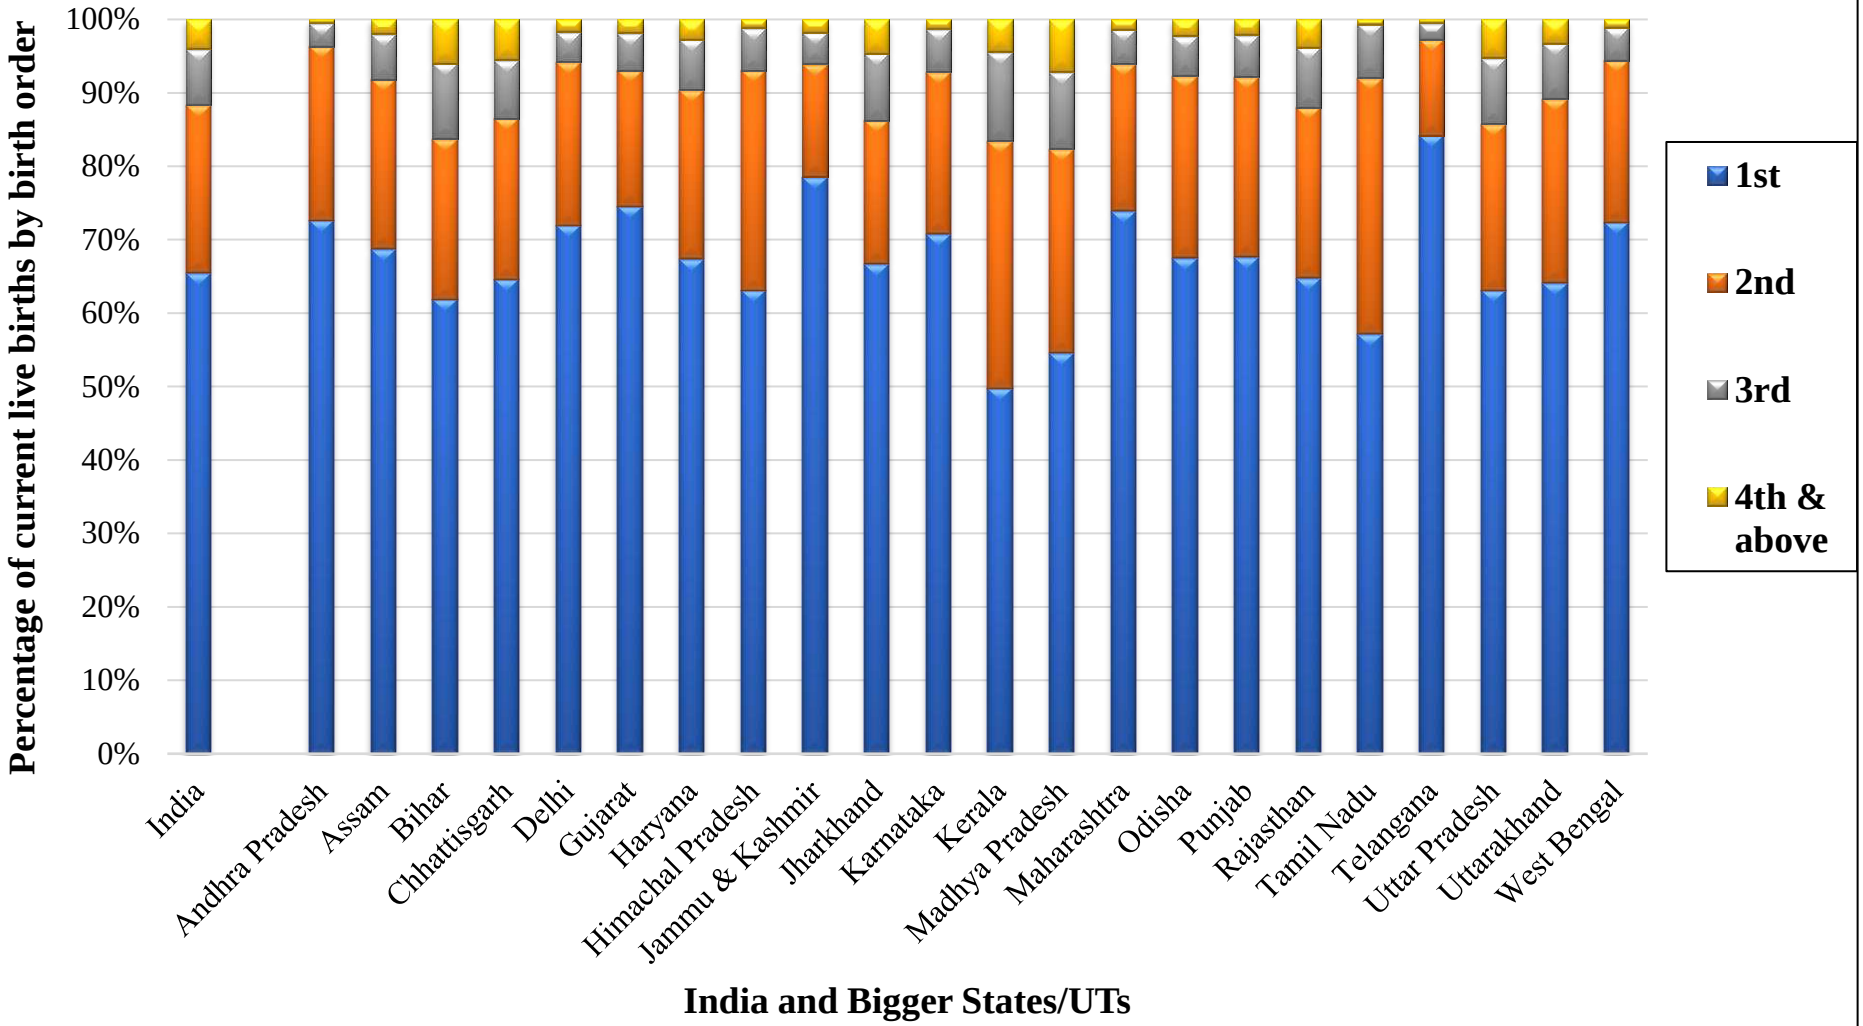

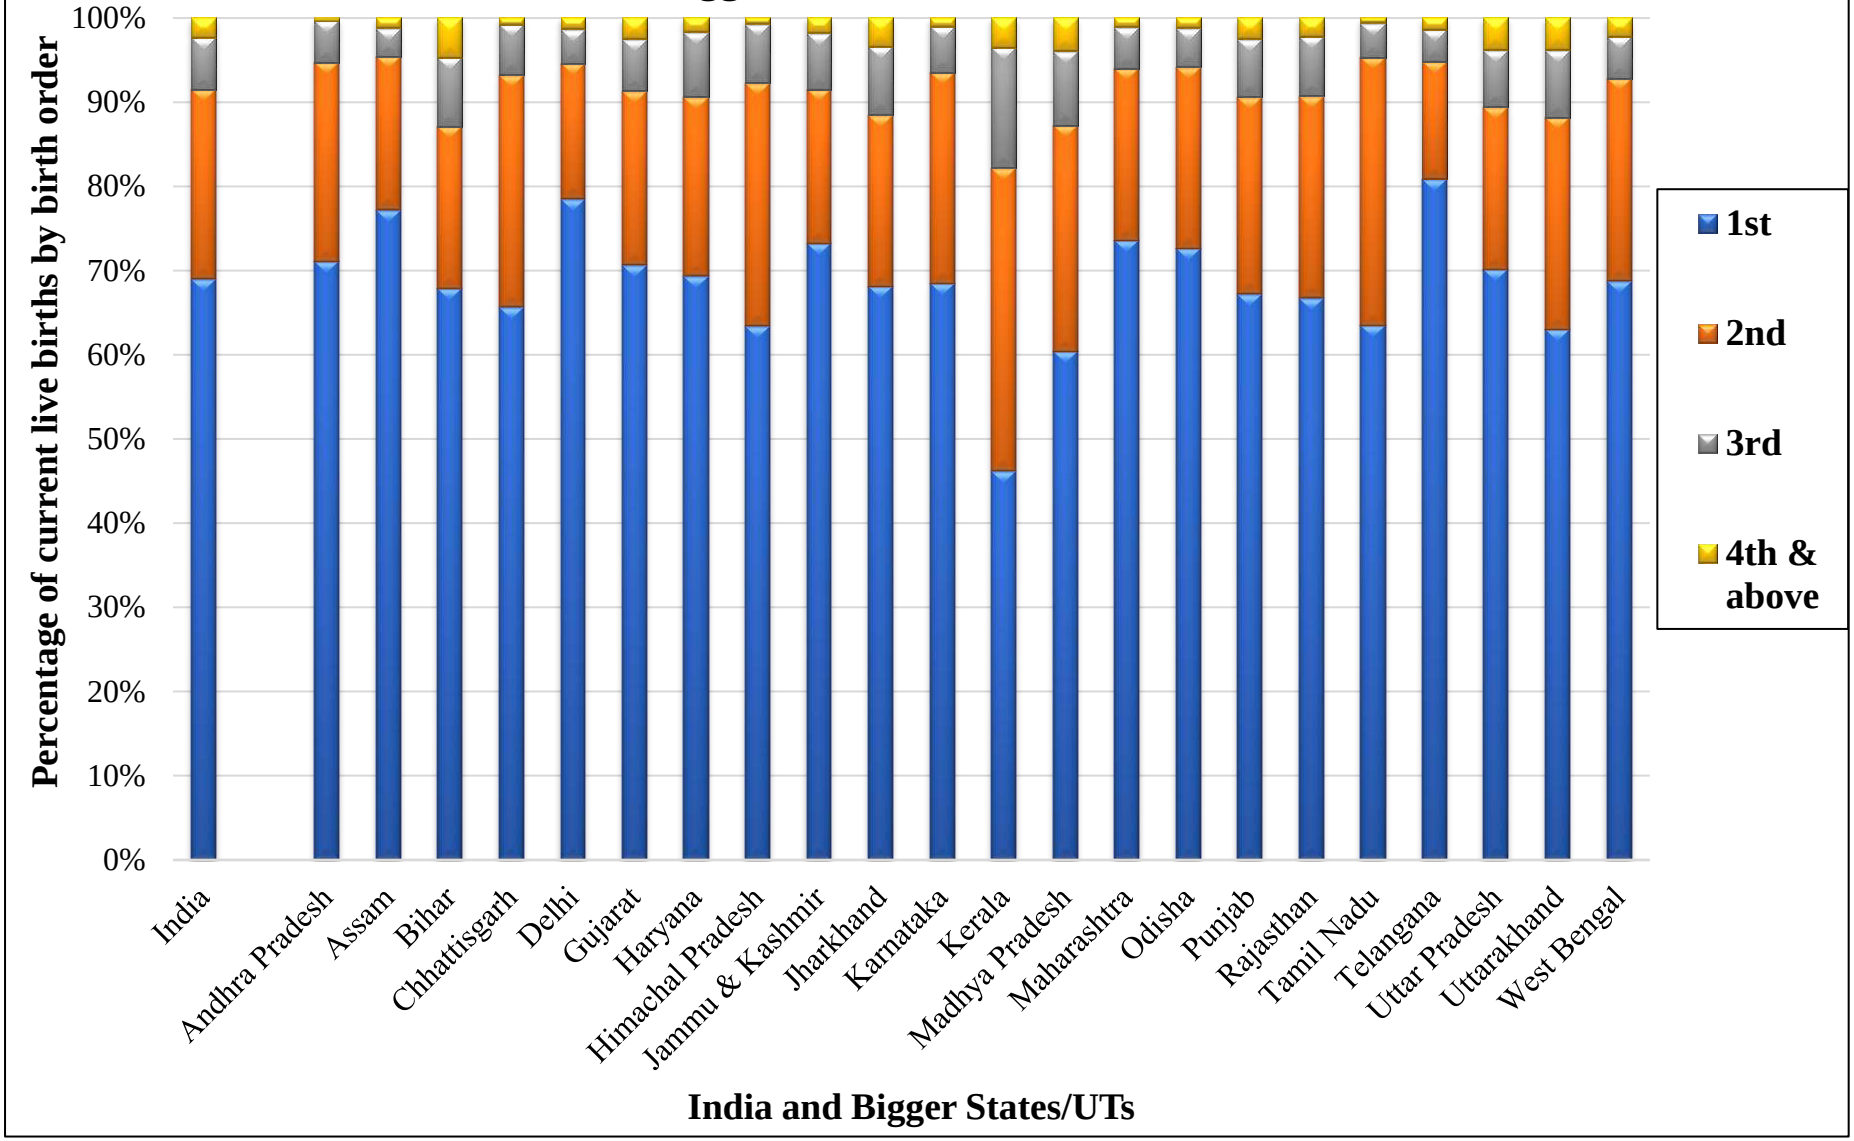

Chart 67: Percentage distribution of current live births by Birth Order, India and Bigger States/UTs, 2024 - URBAN

Birth Interval:

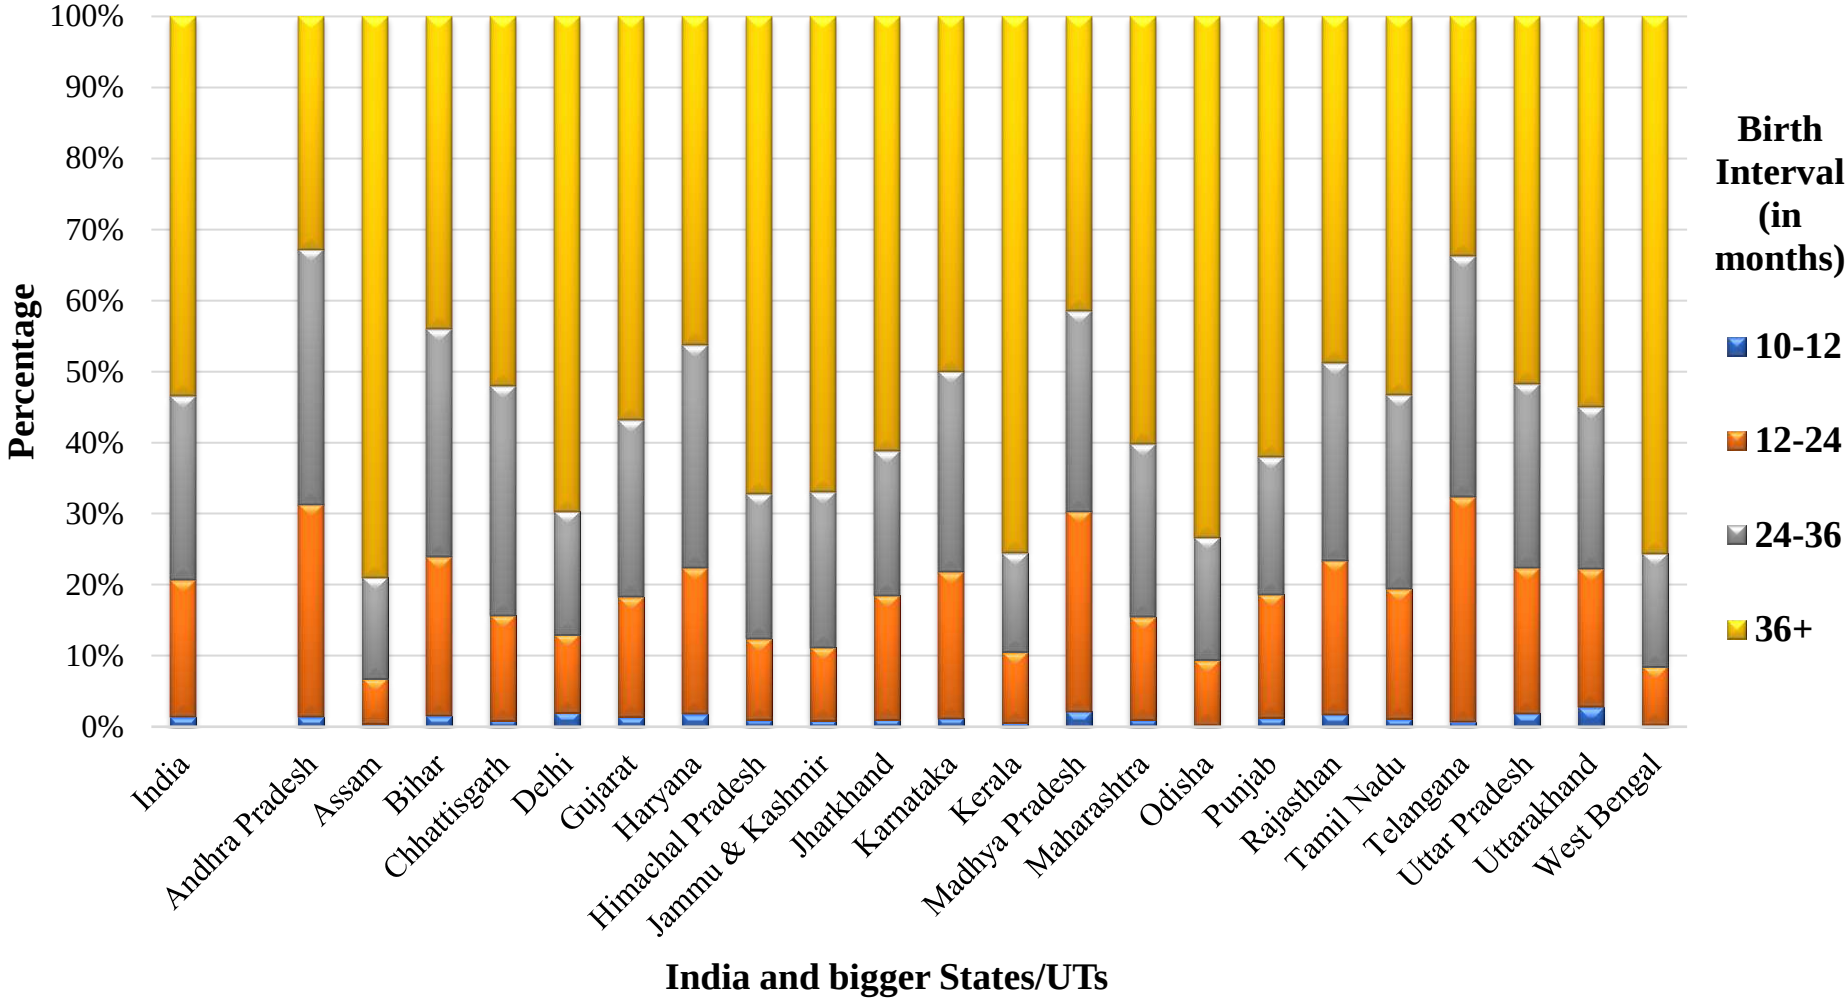

3.34 The percentage distribution of second and higher-order live births by interval between current and previous live birth is shown below in Statement 37 for India and bigger States/UTs for the year 2024. For India, 1.4% of second and higher-order live-births occurred within 10-12 months of the previous live birth, 19.3% occurred within 12-24 months, 25.8% occurred within 24-36 months, and 53.5% occurred 36 months or more after the previous live birth. Looking at the individual States and UTs, we can see that the percentage distributions vary considerably. The percentage of second and higher-order live-births occurred within 10-12 months of the previous live birth and ranged from 0.3% in Odisha and West Bengal to 2.7% in Uttarakhand. The percentage of second and higher-order live-births occurred after 36 months or more after the previous live birth ranged from 32.8% in Andhra Pradesh to 79% in Assam. Chart 68 presents the percentage distribution of second and higher-order live-births by interval for India and bigger States/UTs.

Statement 37

Percentage Distribution of Second and higher order live Births by Interval, India and Bigger States/UTs, 2024

Chart 68: Percentage distribution of second and higher order live births by interval, India and bigger States/UTs, 2024

3.35 Statement 38 below presents the percentage distribution of second and higher-order live births by the interval between current and previous live birth separately for rural and urban areas in 2024. In India, 1.4% of second and higher-order live births in rural areas occurred within 10-12 months of the previous live birth, while 20.6%, 26.6%, and 51.4% of births occurred within 12-24 months, 24-36 months and 36+ months respectively. In urban areas, the percentage distribution of live births by interval was 1.3%, 15.5%, 23.7%, and 59.5% respectively. The percentage distribution of live births by interval and residence varied across different States and UTs. Charts 69 and 70 give the percentage distribution of second and higher order live births by interval for rural and urban areas respectively.

Statement 38

Medical attention received by Mother at delivery:

3.36 While recording details of every outcome of pregnancy during continuous enumeration and half yearly survey, the enumerators and supervisors are required to enquire about the type of medical attention received by the mother at the time of delivery/abortion of the new born. Statement 39 below gives the percentage distribution of live births recorded in the year 2024 by type of medical attention received by the mother at the time of delivery for India and bigger States/UTs separately by rural and urban areas. Looking at the data, we can see that the majority of live births in India were attended by medical professionals in government hospitals, accounting for 71.7% of all live births followed by 23.7% of live births in private hospitals. Only 2.4% of live births were attended by qualified professionals, while 1.8% were attended by untrained functionaries and others and just 0.4% of live births received no medical attention in 2024. The data also shows that the percentage distribution of live births by type of medical attention received varies by residence. For example, in India, a higher proportion of live births in rural areas were attended by medical professionals in government hospitals (76.6%) compared to urban areas (56.9%). Conversely, a higher proportion of live births in urban areas were attended by medical professionals in private hospitals (41.0%) compared to rural areas (18.0%). No medical attention was received by mothers in 0.5% of rural cases and 0.0% of urban cases.

3.37 The percentage distribution of live births by type of medical attention received varied across States and UTs. Births attended by medical professionals in government hospitals varies from 30.4% in Kerala to 95.5% in Jammu and Kashmir. In contrast, medical attention at the time of delivery were attended by medical professionals in private hospitals vary from 3.9% in Jammu & Kashmir to 69.6% in Kerala. Charts 71, 72, and 73 depict the percentage distribution of live births by type of Medical Attention received by the mother for Total, Rural, and Urban areas respectively.

Statement 39

CHAPTER 4

ESTIMATES OF MORTALITY INDICATORS

Mortality is one of the basic components of population change and the related data is essential for demographic studies and public health administration. It is the principal ingredient for population projections and life tables. Information on death events recorded in SRS is used to estimate mortality indicators. The various measures of mortality published under SRS are Crude Death Rate (CDR), Under-five Mortality Rate (U5MR), Infant Mortality Rate (IMR) and its components, Age-Specific Mortality Rates (ASMR), Still Birth Rate (SBR) and Peri-Natal Mortality Rate (PMR).

4.2 SRS has continued to provide data for estimating various mortality measures since its inception. The Crude Death Rate at all India level has declined from 14.9 to 12.5 during the decade 1971 to 1981. In the next three decades ending 1991, 2001 and 2011, the Crude Death Rate reached 9.8, 8.4 and 7.1 respectively and thereafter from 7.5 to 6.4 during 2021 to 2024. The decline has been steeper in rural areas as compared to urban areas meaning the decline in rural areas is greater while the decline in urban areas is gradual. The Infant Mortality Rate has shown a considerable decline from 129 per 1000 live births in 1971 to 110 in 1981 and from 80 in 1991 to 24 in 2024.

4.3 Apart from the all India scenario, this chapter presents data on mortality indicators for bigger States/UTs by sex, residence and broad age-groups. Besides Under-Five Mortality Rate, it includes data on Infant Mortality and its components viz., Neo-Natal Mortality and Post Neo-Natal, Peri-Natal Mortality and changes in mortality over the last decade. It also includes data on medical attention before death.

4.4 Apart from the mortality indicators at State and National levels, this report also includes estimates of death rates at sub-State, viz. NSS Natural Division Level. The Table 11 in the annexure to this report contains data on Death Rate and Infant Mortality Rate besides Birth Rate for 71 Natural Divisions of 22 bigger States/UTs.

4.5 Statement 40 below provides the Crude Death Rate (CDR) by residence for India and States/UTs for the year 2024. Although the death rate has been estimated for all the States/UTs of India, the other mortality indicators are presented only for bigger States/UTs in the report. The overall CDR for India in 2024 was 6.4, with a higher CDR of 6.8 in rural areas and a lower CDR of 5.6 in urban areas. Among the bigger States/UTs, Chhattisgarh had the highest CDR of 8.4, while Delhi had the lowest CDR of 4.5. Among the smaller States, Manipur had the lowest CDR of 4.4 and Goa had the highest CDR of 6.5. Among the UTs, Puducherry had the highest CDR of 6.2, while Chandigarh had the lowest CDR of 3.9. Based on the figures in the Statement 40 below, the graphical representation of death rate of States/UTs by residence is depicted in Charts 74 and 75. The estimated Age-Specific Death Rate by sex and residence for India and bigger States/UTs has been detailed in Table 8.

Statement 40

CDR (Crude Death Rate) by Residence, India and States/UTs, 2024

India and bigger States/UTs	Total	Rural	Urban

Chart 74: Crude Death Rate by Residence, India and States/UTs, 2024

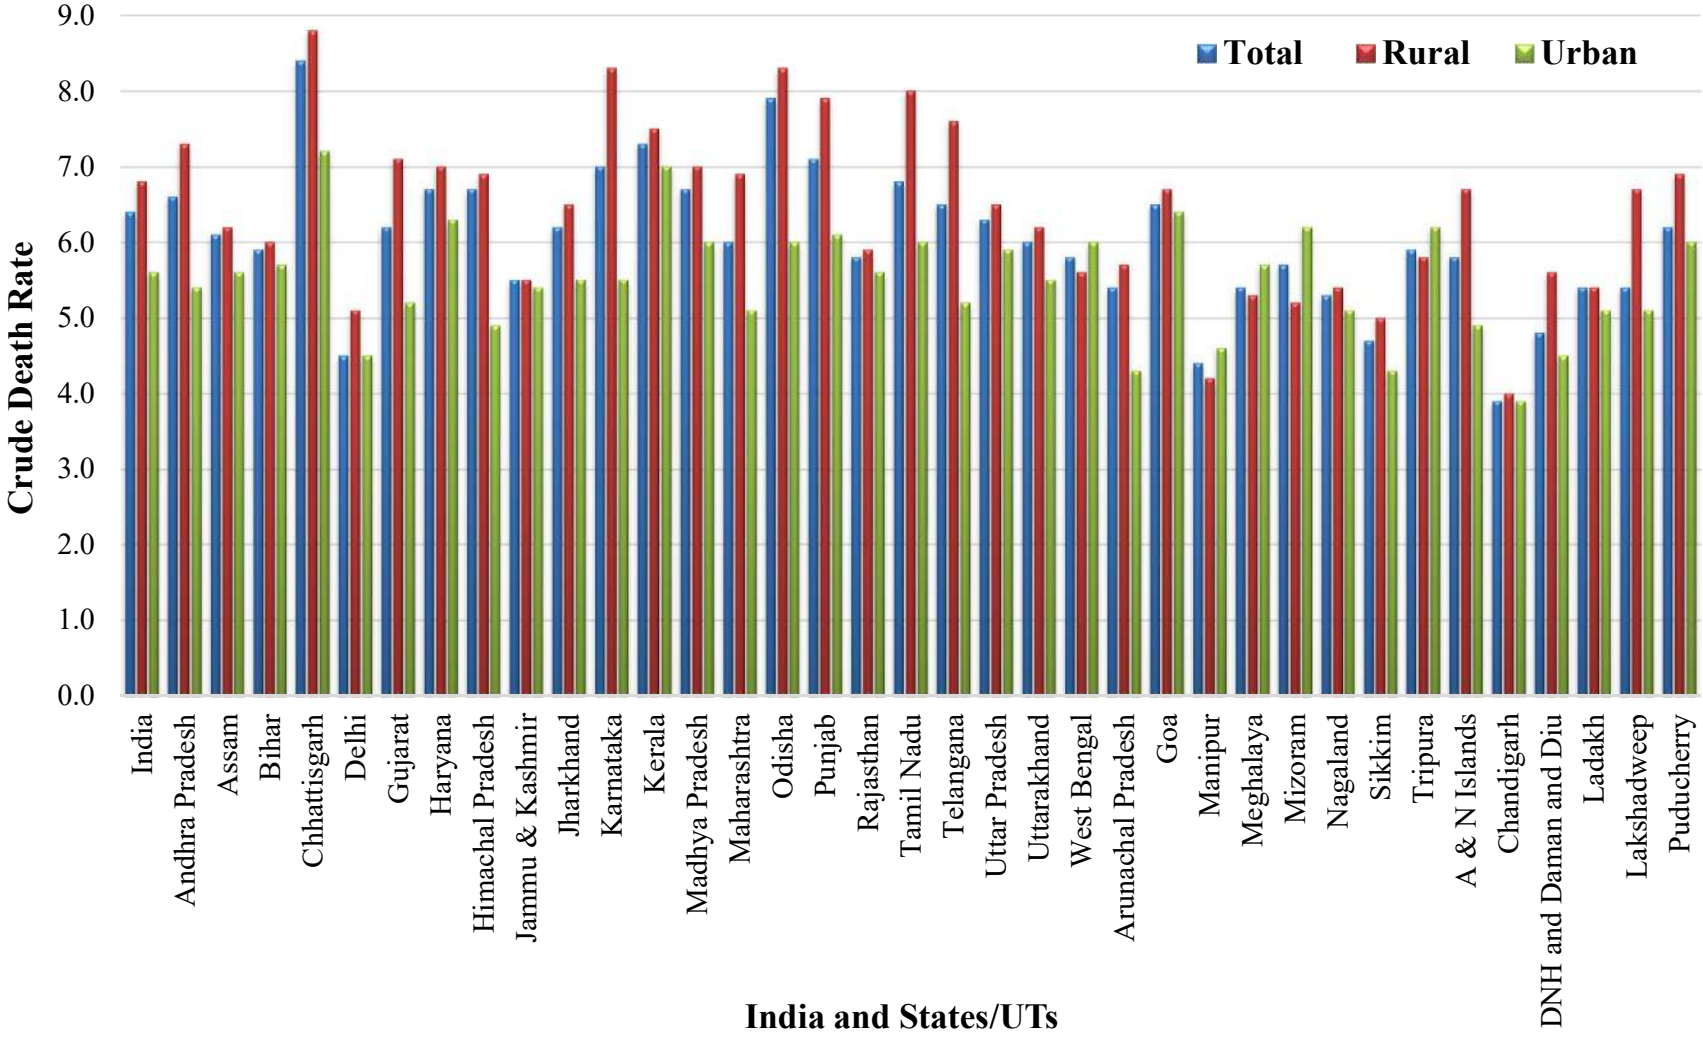

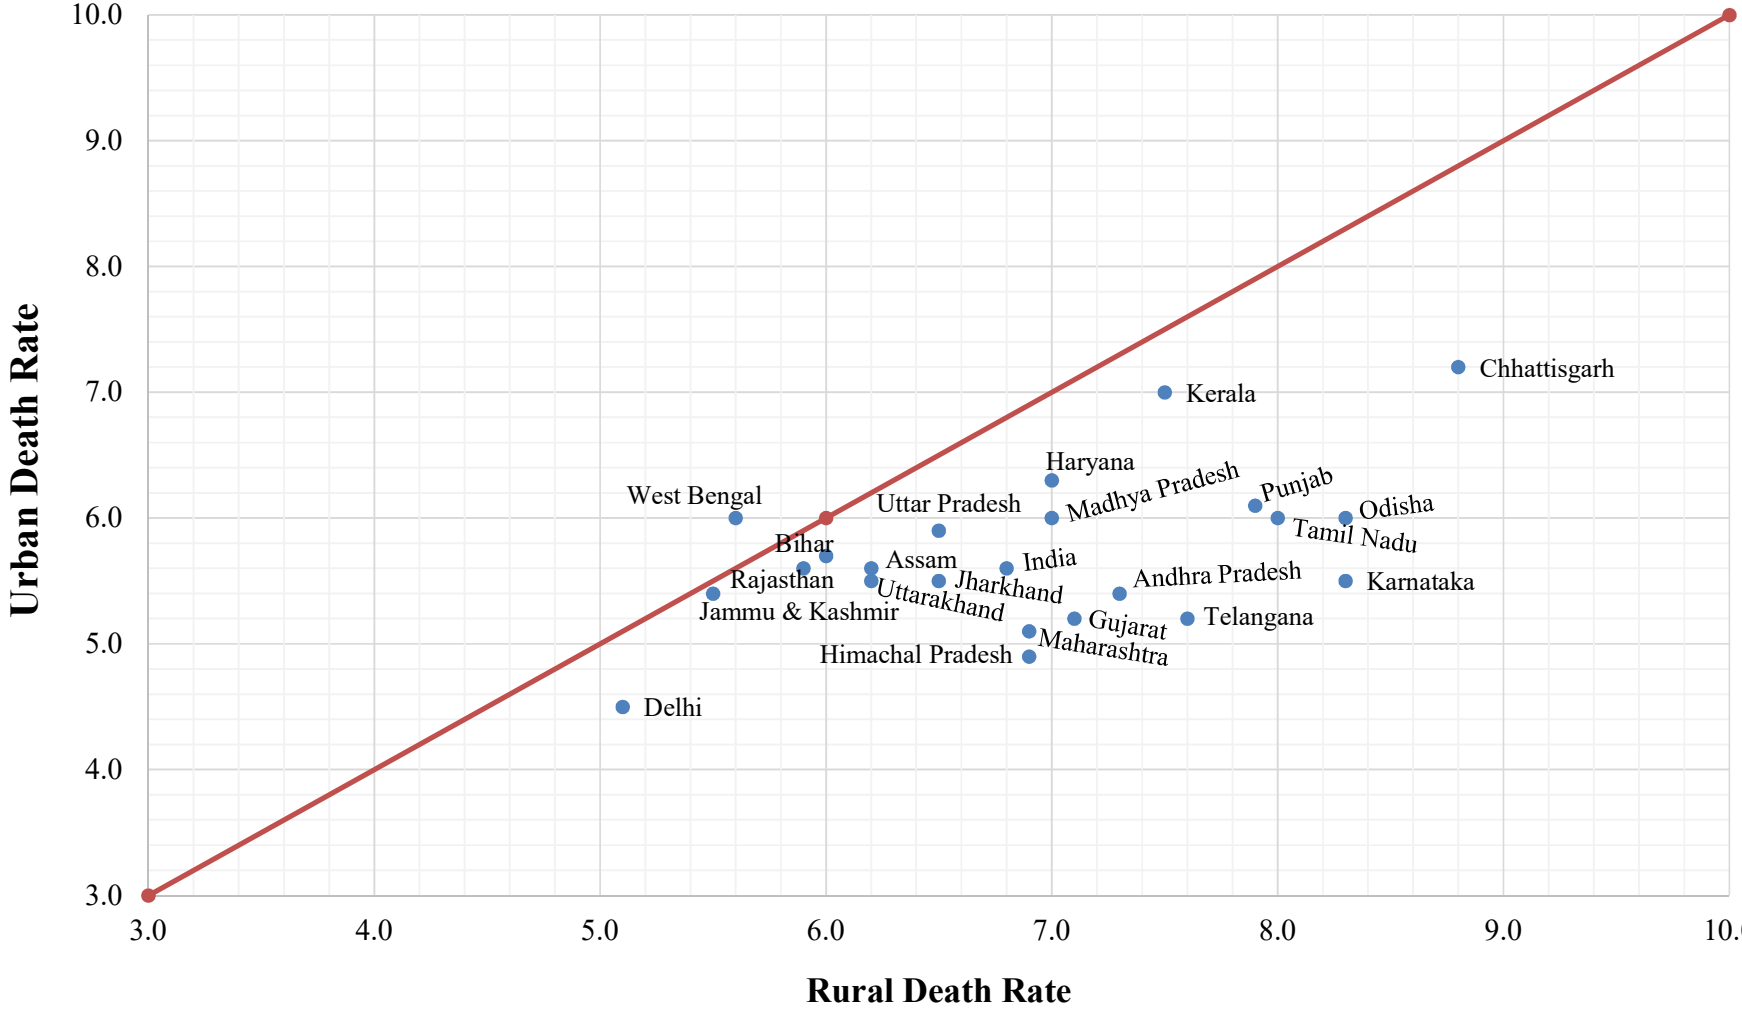

Chart 75: Distribution of Bigger States/UTs by Death Rate for Rural and Urban areas, 2024

4.6 Statement 41 given below shows the percentage change in the level of Crude Death Rate between the period 2012-14 and 2022-24 for India and bigger States/UTs. Overall, there was a decrease in the Crude Death Rate in India from 6.9% in 2012-14 to 6.5% in 2022-24, representing a decline by 5.8%. The rural Crude Death Rate also decreased from 7.5% to 6.9%, a percentage change of -8.0%, while the urban Crude Death Rate increased from 5.6% to 5.8%, a percentage change of 3.6%. Among the bigger States and Union Territories, there was a significant decrease in the Crude Death Rate for Assam (-17.1%), Uttar Pradesh (-14.5%) and Madhya Pradesh (-12.7%), while the highest increase in the Crude Death Rate was for Punjab (15.2%) followed by Haryana (11.1%), Chhattisgarh (10.3%) and Delhi (9.8%). Other States and Union Territories showed more modest changes in the Crude Death Rate over the period. Charts 76, 77, and 78 depict the average death rate between 2012-14 and 2022-24 in India and bigger States/UTs for Total, Rural and Urban areas respectively along with the respective rate of change. Chart 79 shows the year-wise death rate from 1985 to 2024 by residence for India.

Statement 41

Average Crude Death Rate and Percentage Change between 2012-14 and 2022-24, by Residence, India and Bigger States/UTs

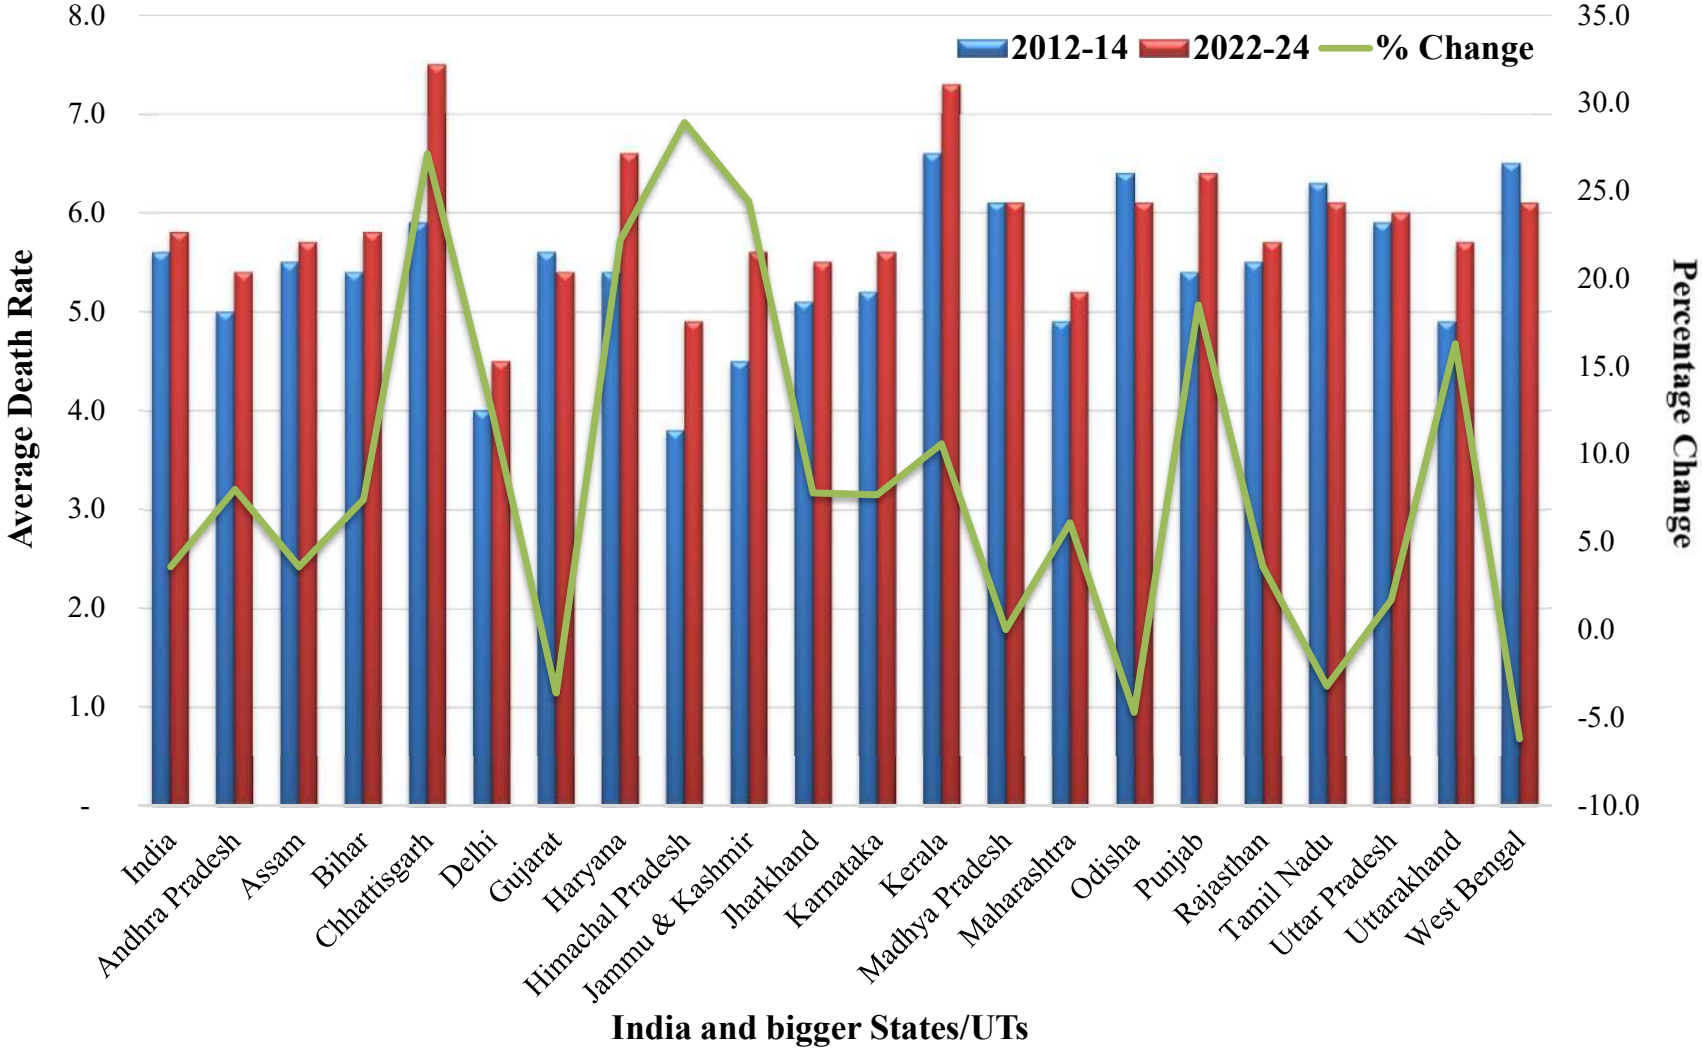

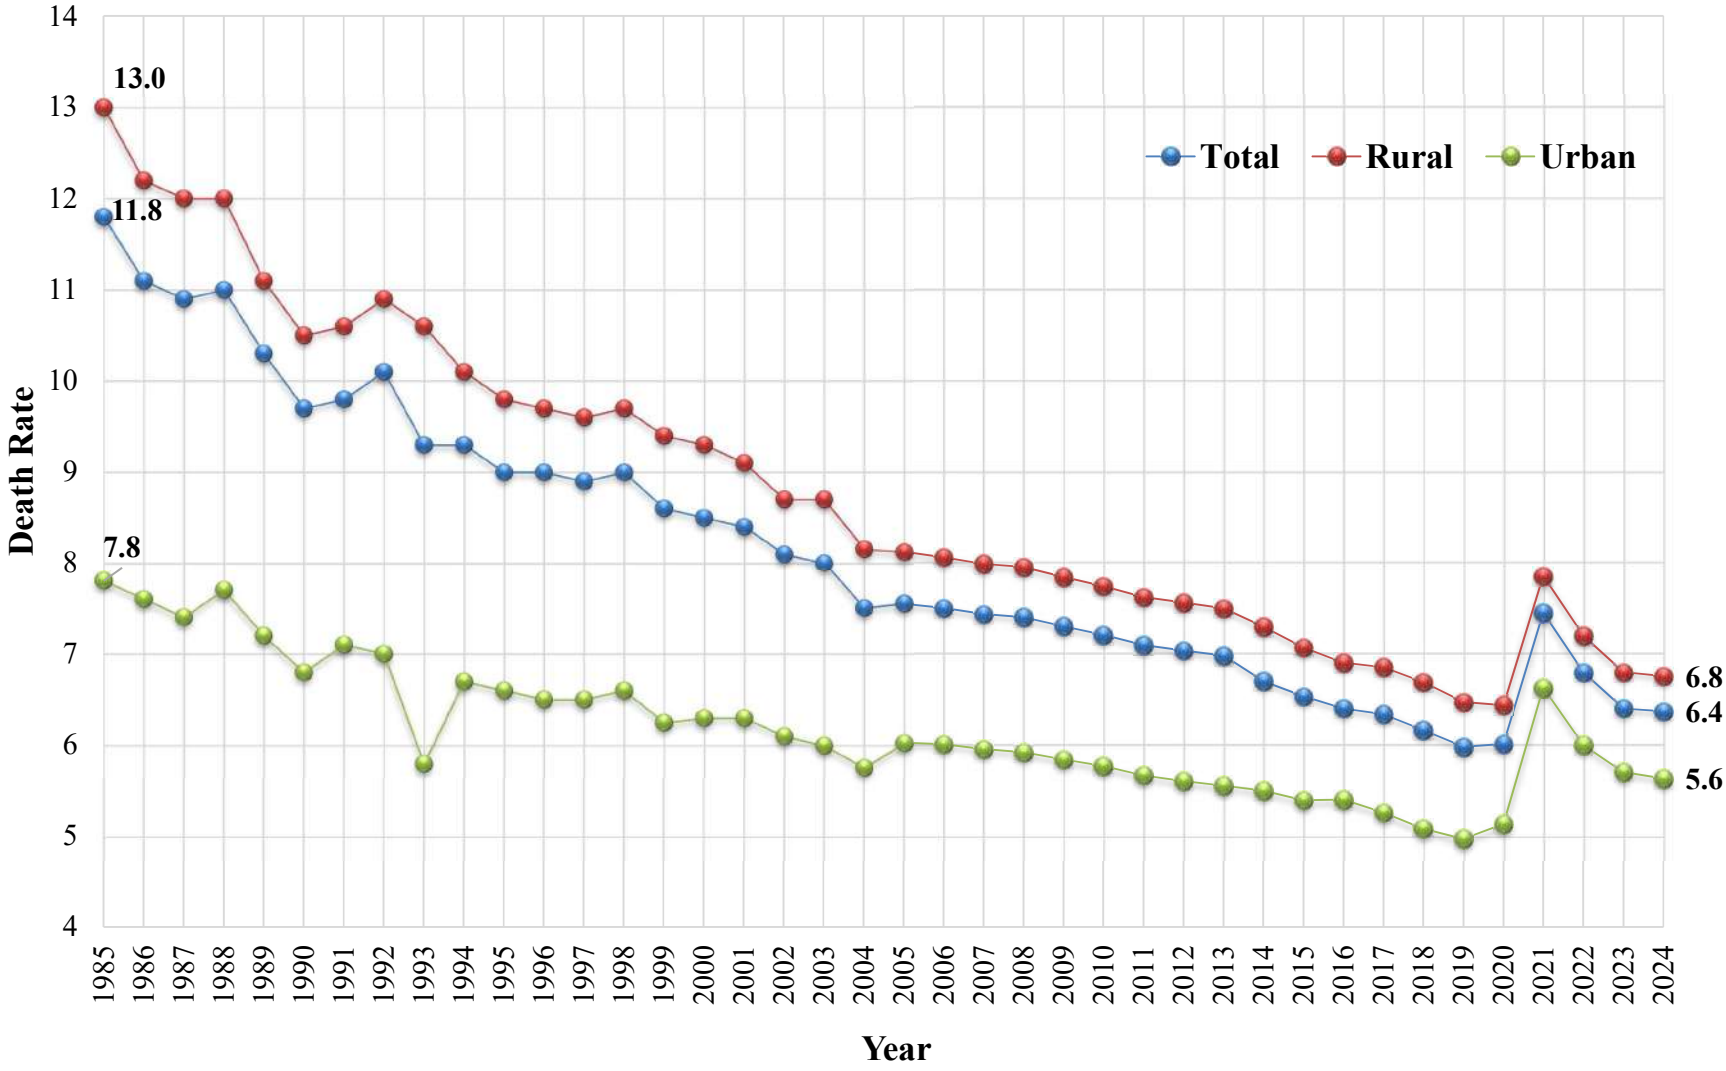

Chart 79: Death Rate 1985 - 2024 by Residence, India

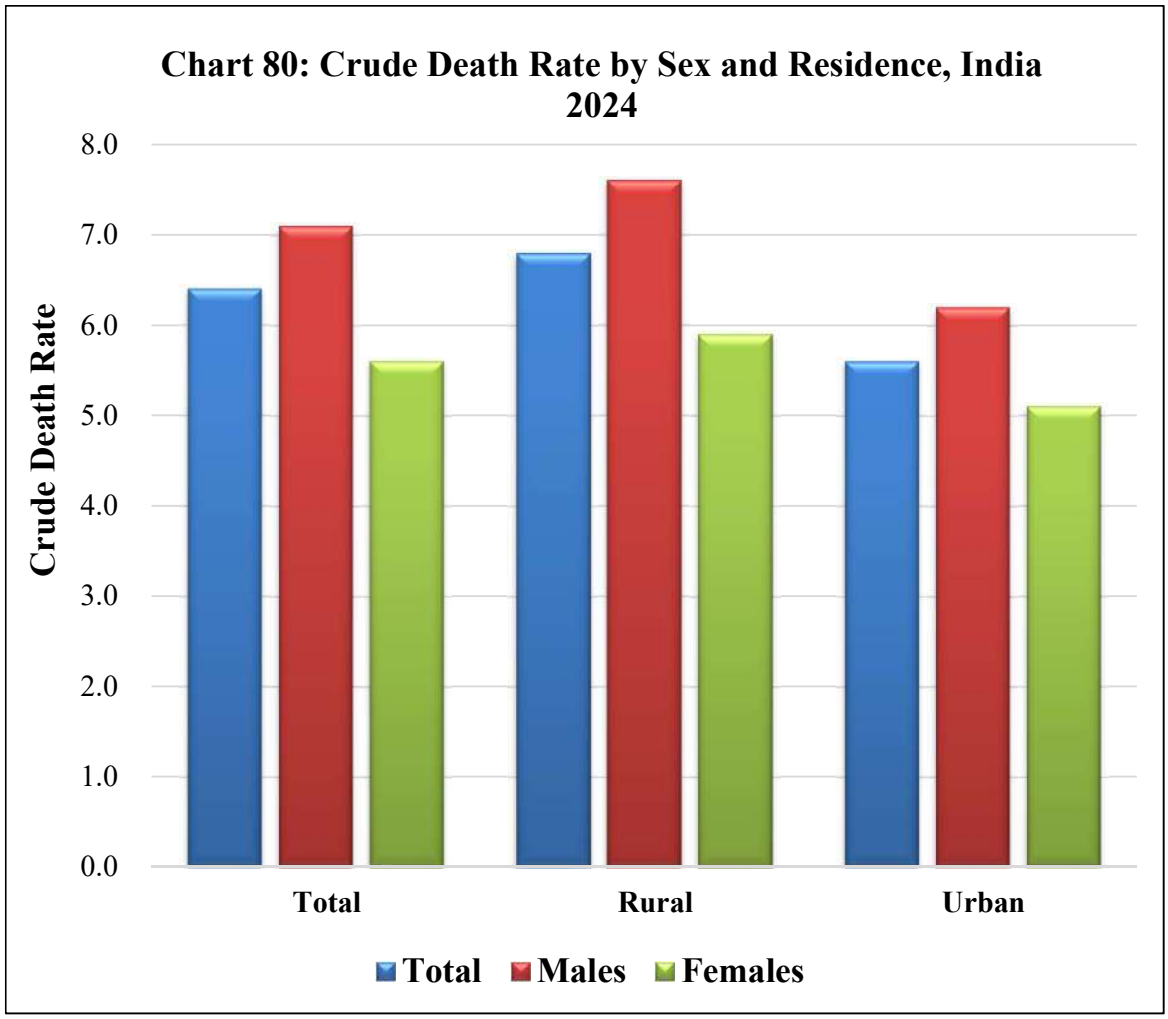

4.7 Statement 42 given below presents the estimated Crude Death Rate for India by residence separately for males and females in 2024. It is observed that female death rate is lower than male death rate both in rural and urban areas. While the total CDR in India in 2024 was 6.4 per 1,000 population. The CDR for males (7.1 per 1,000 population) was higher than that for females (5.6 per 1,000 population). The CDR was also higher for rural areas compared to urban areas. Chart 80 represents the Crude Death Rate by sex and residence for India.

Statement 42

Crude Death Rate by Sex and Residence, India, 2024

Residence	Total	Males	Females
Total	6.4	7.1	5.6
Rural	6.8	7.6	5.9
Urban	5.6	6.2	5.1

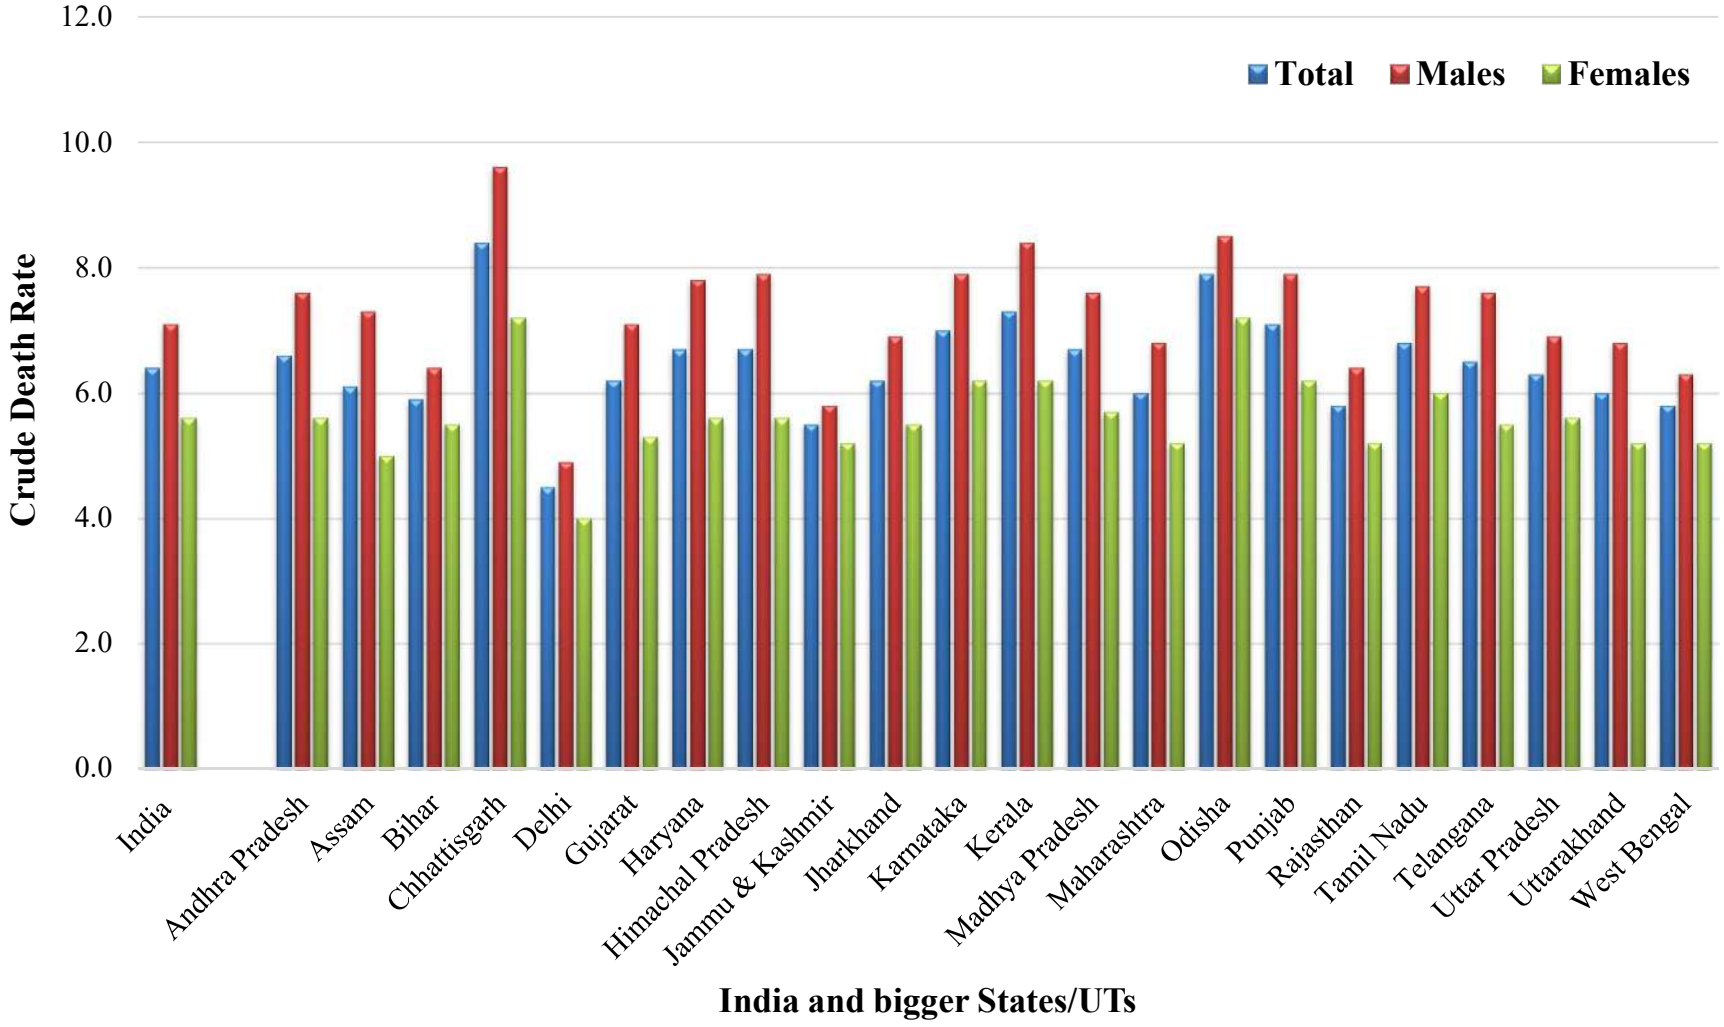

4.8 Crude Death Rates for males and females in the bigger States/UTs for 2024 are shown below in Statement 43. Among the bigger States/UTs in India, the highest CDR was recorded in Chhattisgarh (8.4) and the lowest rate in Delhi (4.5). The Crude Death Rate for males is higher than that for females across all States and Union Territories presented. For Males, the highest death rate was recorded in Chhattisgarh (9.6) and the lowest in Delhi (4.9). For females, the death rate was highest in Odisha and Chhattisgarh (7.2) and lowest in Delhi (4.0) in 2024. Chart 81 shows Crude Death Rate by sex for India and bigger States/UTs.

Statement 43

Chart 81: Crude Death Rate by Sex, India, and Bigger States/UTs, 2024

Deaths by broad age-group:

4.9 Statement 44 given below provides the percentage distribution of deaths by broad age-groups for India and bigger States/UTs for the year 2024. The data reveals that a significant proportion of deaths in India and most of the bigger States/UTs occurred among people aged 60 years and above, with the highest proportion recorded in Kerala (79.4%) followed by Himachal Pradesh (73.7%), Maharashtra (67.2%), and Tamil Nadu (65.2%). In the other age groups, the '<1 year' age-group had the highest proportion of deaths in Uttar Pradesh (13.2%) and Madhya Pradesh (11.9%). The 5-14-year age-group had the highest proportion of deaths in Bihar (2.3%). Chart 82 gives pictorial distribution of deaths by broad age-group in India and bigger States/UTs. The percentage distribution of deaths to total deaths, by residence, sex and age-group at the National level and for the bigger States/UTs are given in Table 10.

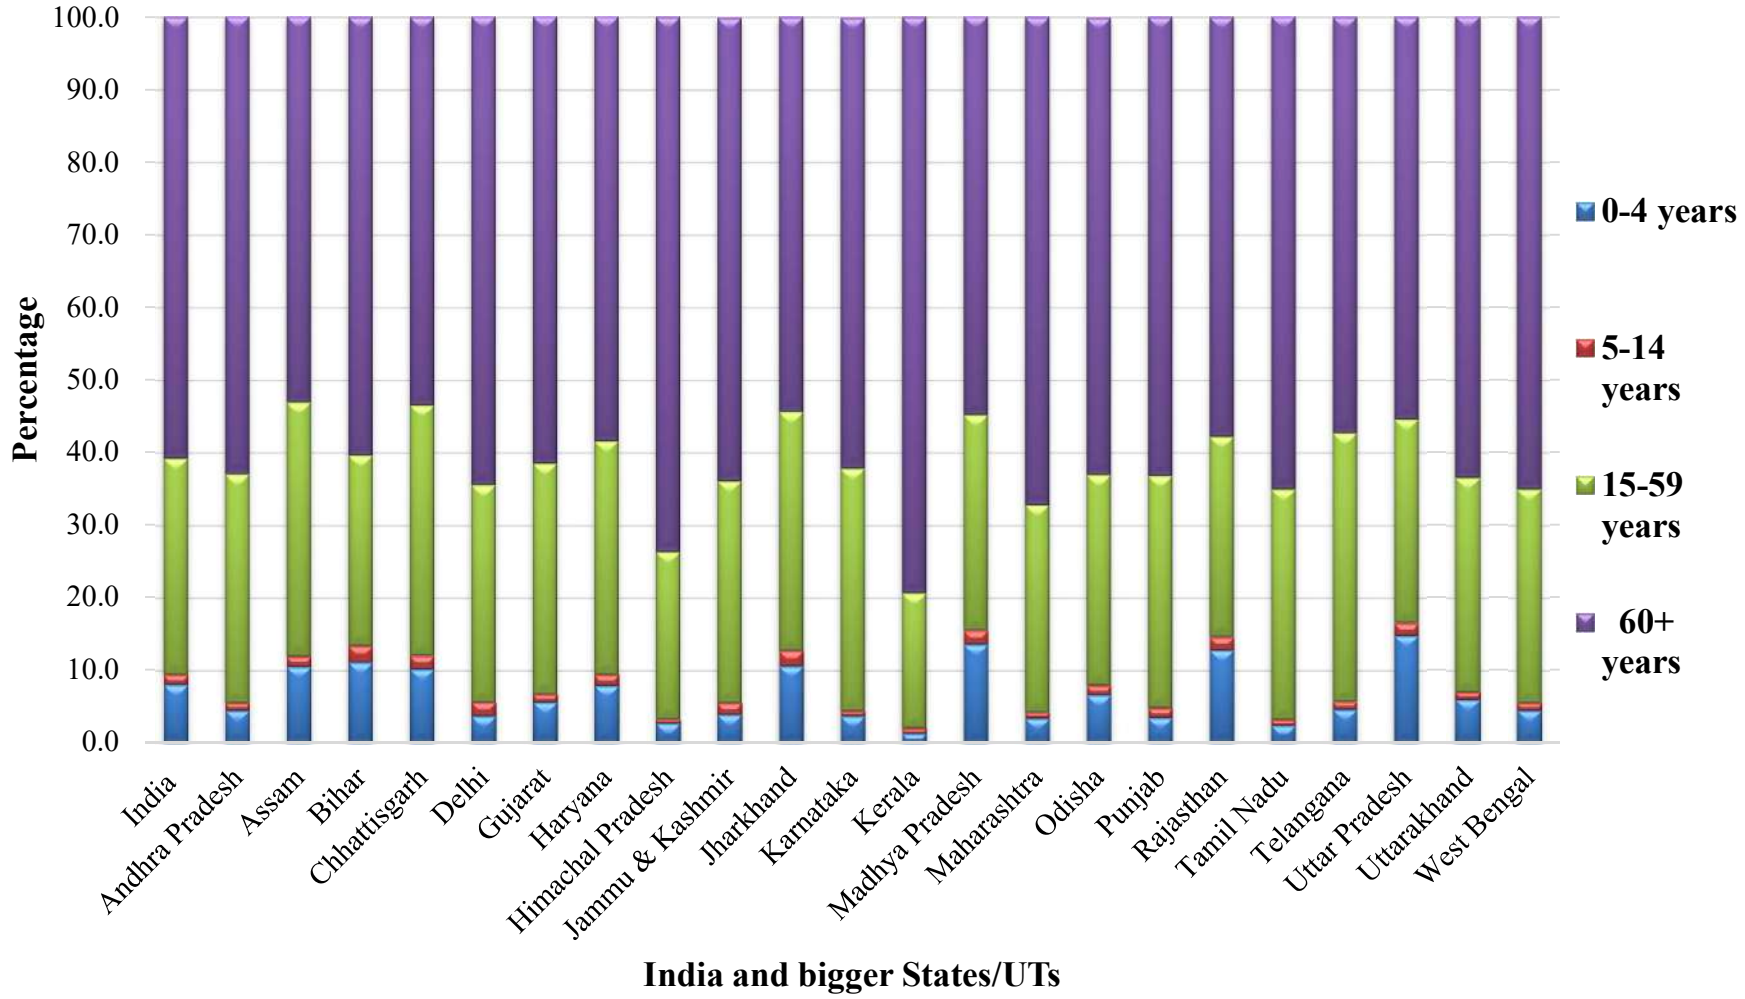

Statement 44

Percentage Distribution of Deaths by broad Age-groups, India, and Bigger States/UTs, 2024

Note: Total may not add up to 100 due to rounding off.

Chart 82: Distribution of deaths by broad age groups, India and Bigger States/UTs, 2024

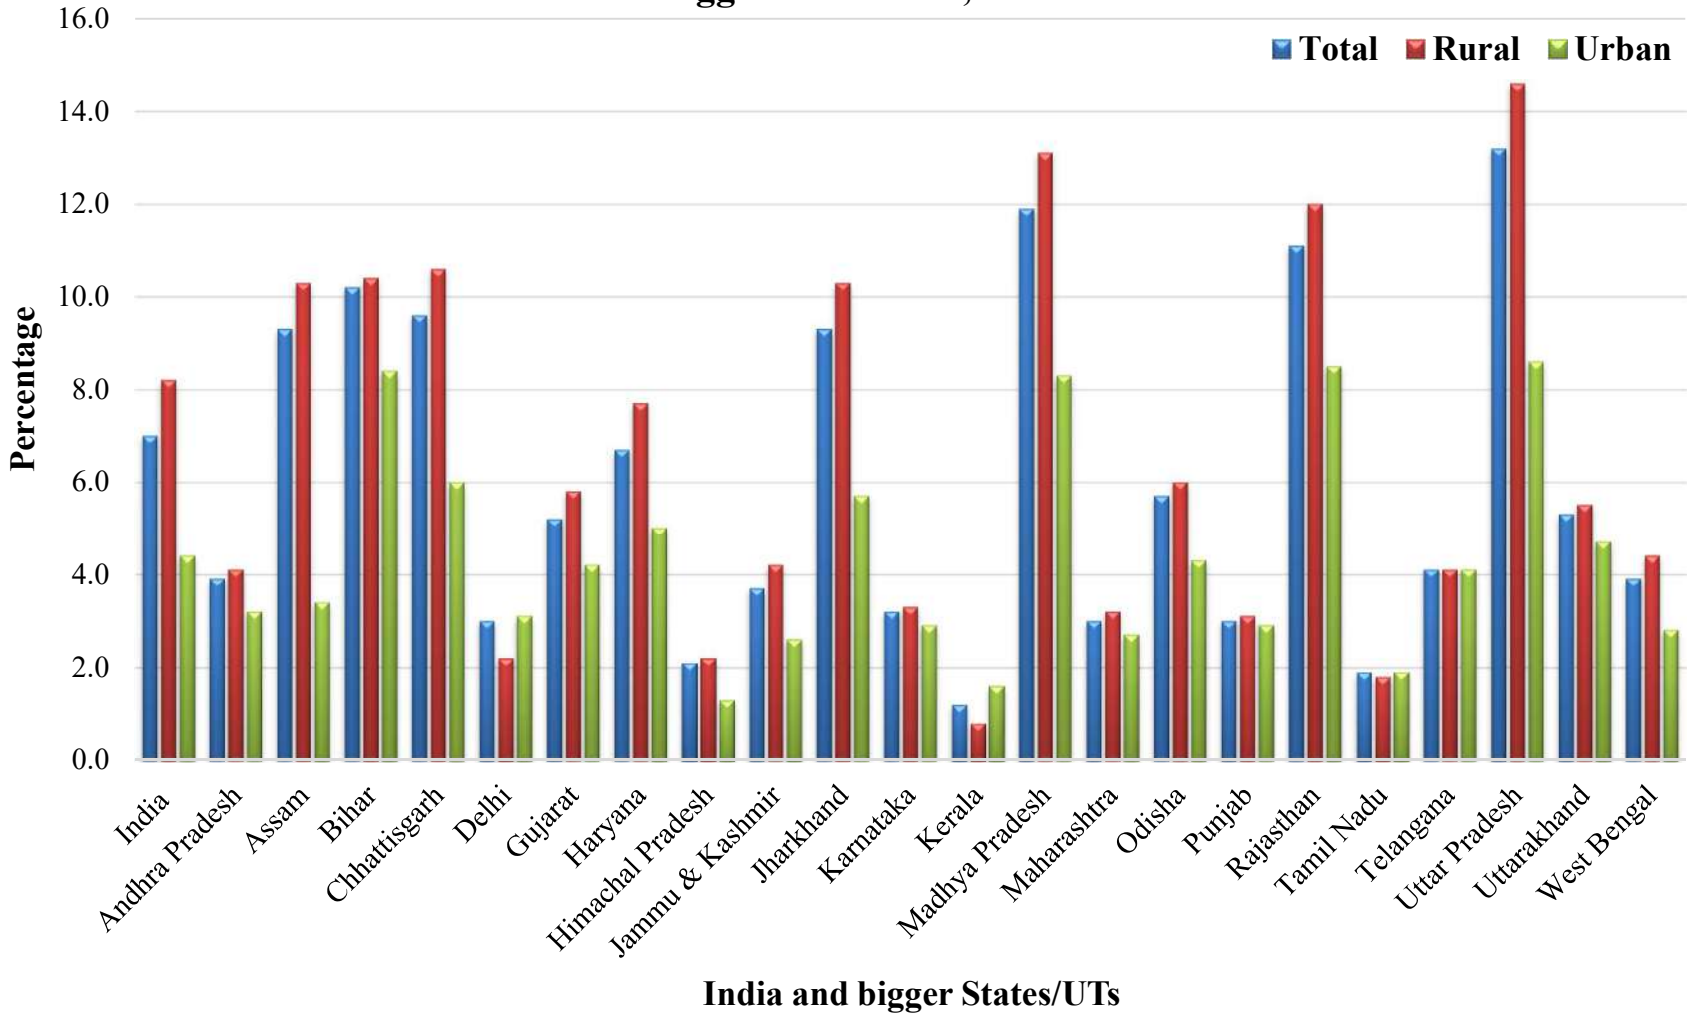

4.10 The percentage share of infant deaths to total deaths by residence for 2024 is shown below in Statement 45 for India and bigger States/UTs. The data shows that in India, 7.0% of deaths were in the 'less than 1 year' age-group while 8.2% of rural deaths and 4.4% urban deaths are of Infants. The percentage vary across different States/UTs, with higher percentage of infant deaths in rural areas compared to urban areas in most cases except Delhi, Tamil Nadu, and Kerala. The percentage of infant deaths varies across different States/UTs, with some States having much higher rates of Infant Mortality than others. For example, Uttar Pradesh has the highest percentage of infant deaths (13.2%) while Kerala has the lowest at 1.2%. However, the higher percentage of infant deaths in rural areas compared to urban areas is consistent across most States/UTs, indicating that this is a nationwide trend. Chart 83 provides the pictorial representation of the percentage of Infants deaths to total deaths by residence for India and bigger States/UTs.

Statement 45

Percentage of Infant Deaths to Total Deaths by Residence, India and Bigger States/UTs, 2024

Chart 83: Percentage of Infant deaths to total deaths by Residence, India and Bigger States/UTs, 2024

Infant Mortality Rate:

4.11 Statement 46 given below presents Infant Mortality Rate (IMR) by sex and residence for the year 2024 for India and States/UTs. The IMR varies across different States/UTs in India, ranging from 2 in Manipur to 36 in Chhattisgarh. In most cases, the IMR is higher in rural areas compared to urban areas. Assam had the highest difference in IMR between rural (31) and urban areas (14). There was also the discernible difference in the IMR between Males and Females in some of the States/UTs. Among the bigger States/UTs, Bihar and Jammu & Kashmir showed the highest gender gap in IMR. In Bihar, the IMR was 21 for males and 25 for females, while in Jammu & Kashmir, it was 16 for males and 12 for females. A & N Islands and DNH had the highest IMR among the UTs with a rate of 9, and Meghalaya had the highest IMR among the smaller States with a rate of 31. Chart 84-86 below represents the IMR by sex for Total, Rural and Urban. Chart 87 presents the distribution of bigger States/UTs by Rural and Urban IMR.

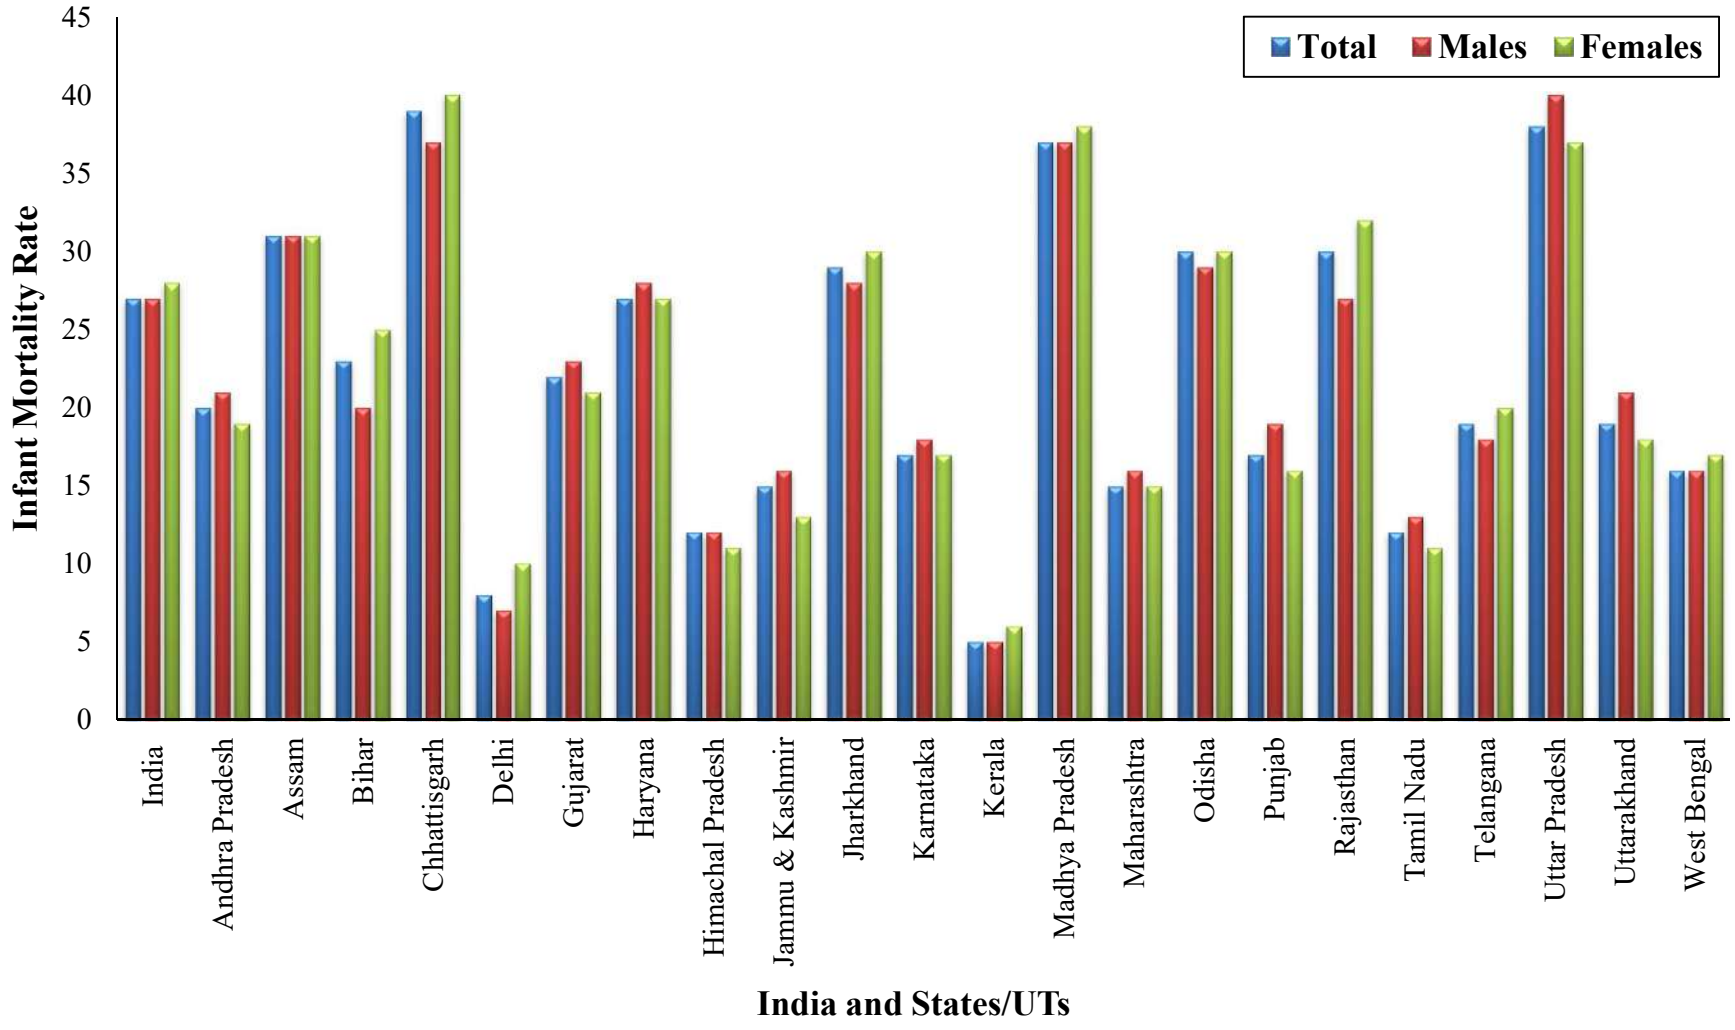

Chart 86: Infant Mortality Rates by sex, India and States/UTs, 2024 - URBAN

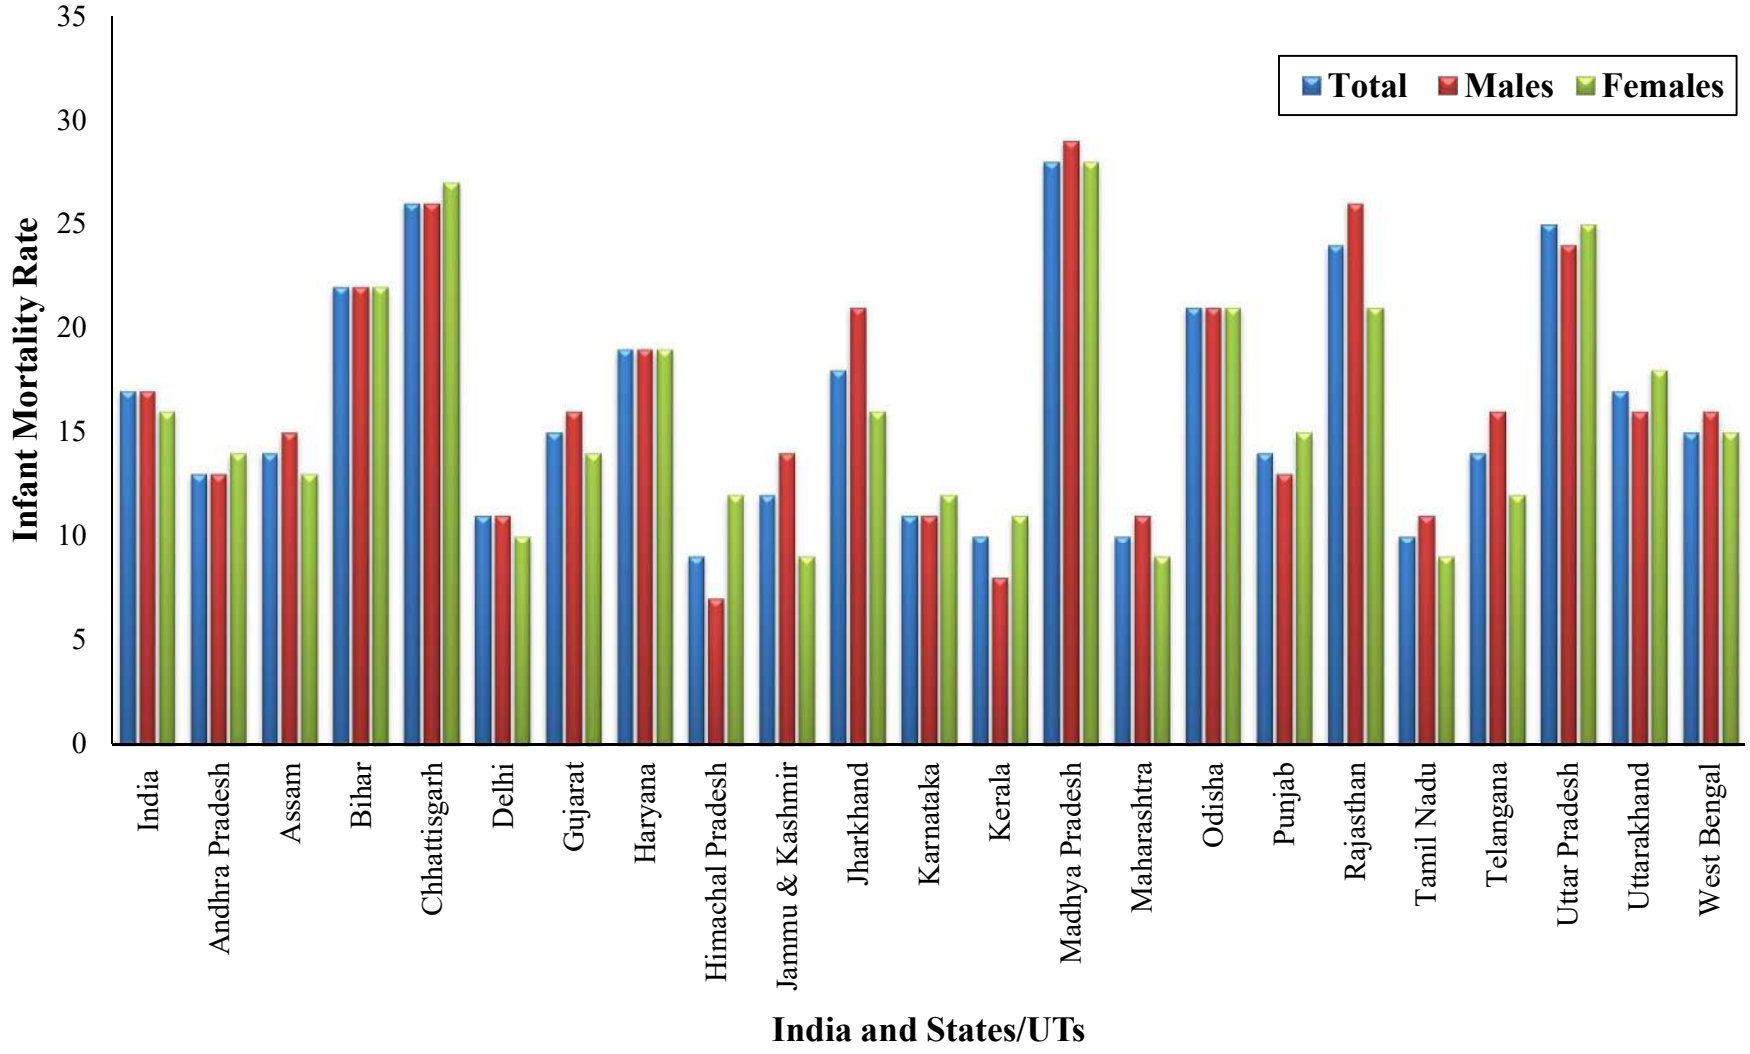

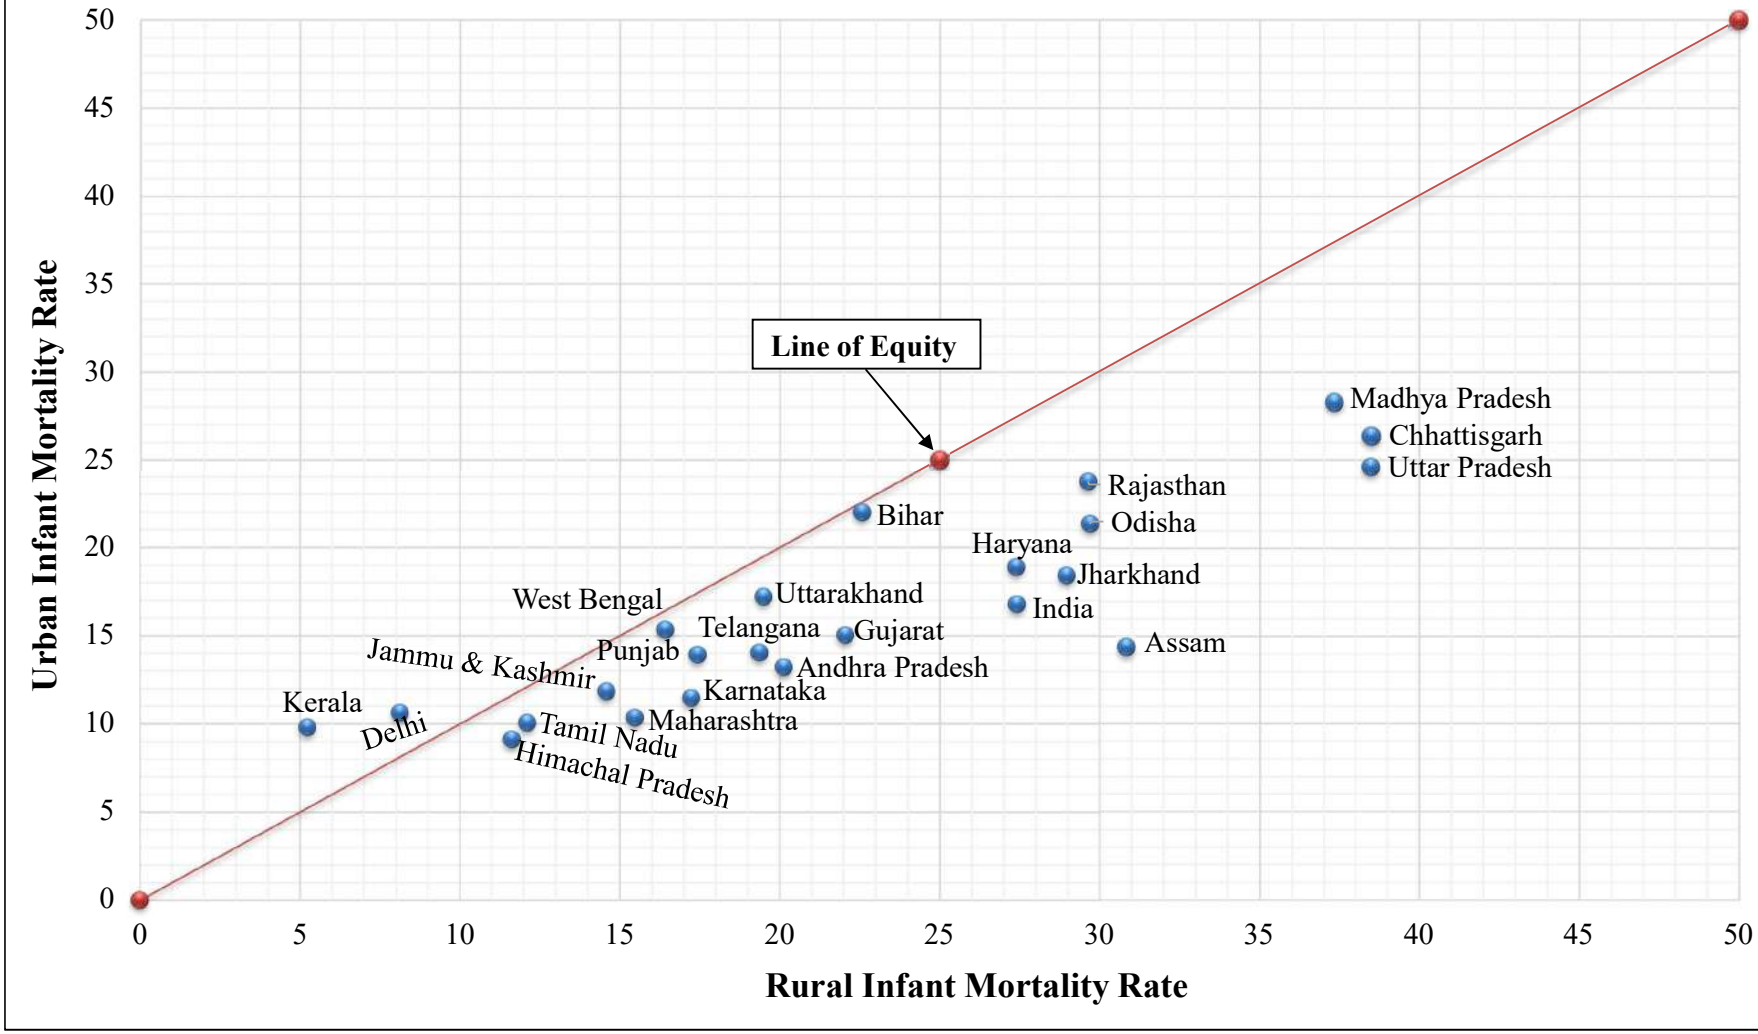

Chart 87: Distribution of bigger States/UTs by Infant Mortality Rate for Rural and Urban areas, 2024

4.12 The percentage change in the average level of Infant Mortality between 2012-14 and 2022-24 in India and the bigger States/Union Territories is given below in Statement 47. The data reveals that the overall Infant Mortality Rate in India has decreased by 37.4% from 40.6 in 2012-14 to 25.4 in 2022-24. The rural Infant Mortality Rate has decreased by 36%, while the urban Infant Mortality Rate has decreased by 35.1%. Among the bigger States/UTs, the highest decline in percentage change for Infant Mortality Rate was observed in Jammu & Kashmir, which is 62.7%. Chhattisgarh had the lowest decline in the percentage for Infant Mortality Rate which is 18.3%. Madhya Pradesh had the highest Infant Mortality Rate in both periods and has shown a decrease of 30.9%. Chart 88 to 90 represents the Infant Mortality Rate between 2012-14 & 2022-24 and the percent change by residence viz, Total, Rural, and Urban for India and bigger States/UTs.

Neo-natal Mortality Rate:

4.13 Statement 48 given below presents the Neo-natal (less than 29 days) Mortality Rate and the percentage of Neo-Natal Deaths (NND) to Infant Deaths (ID) for the year 2024 both for India and the bigger States/UTs. India's overall Neo-Natal Mortality Rate was 18 deaths per 1,000 live births in 2024, with a higher rate in rural areas (20 deaths per 1,000 live births) than in urban areas (12 deaths per 1,000 live births). The percentage of Neo-Natal deaths to infant deaths was 72.8% indicating that a significant proportion of infant deaths occurred within the first 28 days of life. Among the bigger States/UTs, Kerala had the lowest Neo-Natal Mortality Rate of 6 deaths per 1,000 live births, while Madhya Pradesh and Chhattisgarh had the highest rate of 26 deaths per 1,000 live births. Maharashtra had the highest percentage of Neo-Natal deaths to infant deaths at 77.9%. Delhi had the lowest percentage of Neo-Natal Deaths to Infant Deaths at 64.3%. Chart 91 to 93 represents the Neo-Natal Mortality Rates and percentage share of Neo-Natal deaths to infant deaths for India and bigger States/UTs by place of residence viz, Total, Rural and Urban.

Statement 48

Neo-Natal Mortality Rate and Percentage Share of Neo-Natal Deaths to Infant Deaths by Residence, India and Bigger States, 2024

Early Neo-Natal Mortality Rate:

4.14 Early Neo-Natal Mortality Rate, i.e. number of infant deaths less than seven days of life per thousand live births, forms an important component of Infant Mortality Rate and more specifically of the Neo-Natal Mortality Rate. Statement 49 given below presents the Early Neo-Natal Mortality Rate along with the percentage of Early Neo-Natal deaths to the total infant deaths for the year 2024. The Early Neo-Natal Mortality Rate in India was 13 in 2024, with higher rates in rural areas (14) than urban areas (9). The percentage share of Early Neo-Natal deaths to infant deaths in India is 52.7, with a slightly higher rate in urban areas (52.9) than in rural areas (52.6). Among the bigger States and Union Territories, Kerala had the lowest early neo-natal mortality rate of 4, while Chhattisgarh and Uttar Pradesh had the highest rate of 19. Punjab had the lowest percentage share of early neo-natal deaths to infant deaths at 44.1, while Kerala had the highest percentage at 59.1. Chart 94 to 96 shows the Early Neo-Natal Mortality Rates and percentage share of Early Neo-Natal deaths to infant deaths for India and bigger States/UTs by place of residence viz, Total, Rural, and Urban.

Statement 49

Peri-Natal Mortality Rate and Still Birth Rate

4.15 Statement 50 given below presents the Peri-Natal Mortality Rate i.e. (number of still births and infant deaths less than 7 days of life per 1000 live births and still births) and Still Birth Rate i.e. (number of fetal deaths after 28 weeks of gestation per 1000 live birth and still birth) for the year 2024 by residence for India and bigger States/UTs. The Total Peri-Natal Mortality Rate in India was 20 in 2024, with a Still Birth Rate of 7. In terms of residence, the rural Peri-Natal Mortality Rate was higher than the urban rate, with a difference of 8. The state of Chhattisgarh had the highest Peri-Natal Mortality Rate of 31and Odisha had the highest Still-Birth Rate of 15. On the other hand, Telangana had the lowest still birth rate of 1 and Delhi had the lowest Peri-Natal Mortality Rate of 7. Chart 97 and 98 represents Peri-Natal Mortality Rate and Still Birth Rate for India and bigger States/UTs by residence respectively.

India and bigger States/UTs

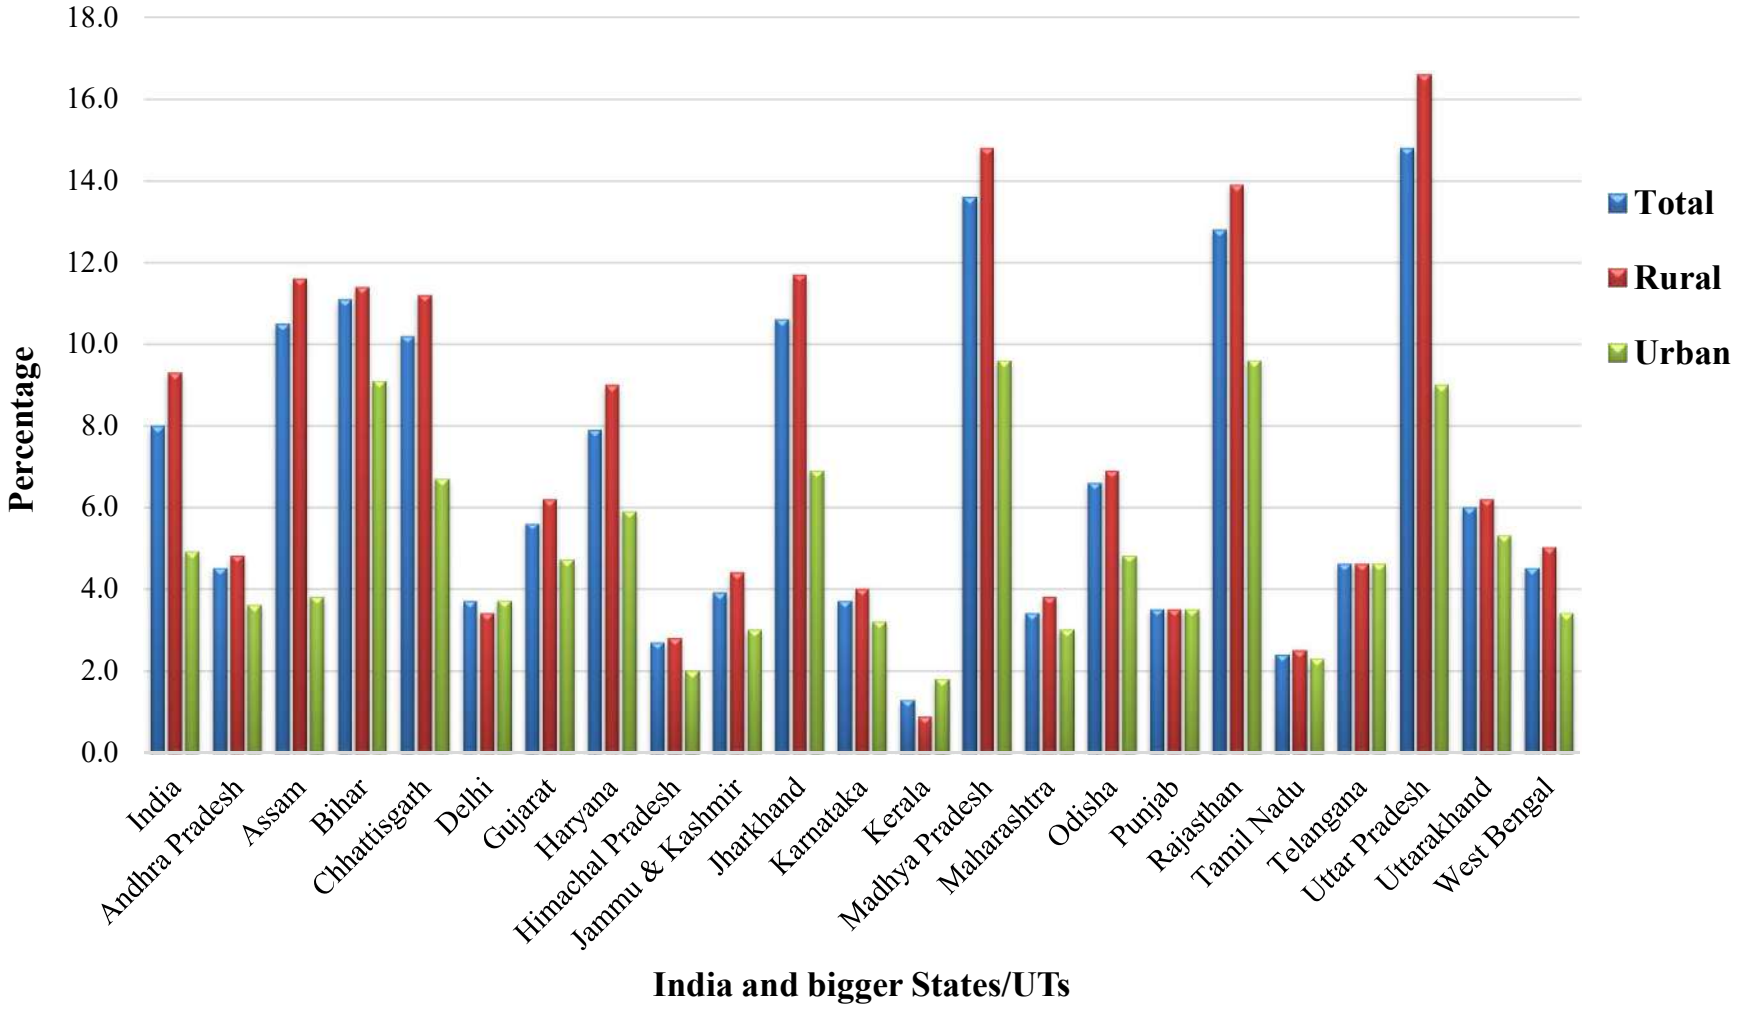

4.16 Percentage share of deaths to children below age five to total deaths by residence for India and bigger States/UTs is shown below in Statement 51. The National average of percentage of deaths in the age-group 0-4 years to total deaths in India was 8.0% in 2024, with a higher proportion in rural areas (9.3%) compared to urban areas (4.9%). Among the States and UTs, Uttar Pradesh had the highest percentage (14.8%) of deaths in the age-group 0-4 years to total deaths, followed by Madhya Pradesh (13.6%) and Rajasthan (12.8%). Kerala had the lowest percentage (1.3%) of such deaths followed by Tamil Nadu (2.4%) and Himachal Pradesh (2.7%). In general, the percentage of such deaths is either constant or higher in rural areas than in urban areas across all States and UTs, with some exceptions like Delhi and Kerala where the proportion is higher in urban areas. Chart 99 shows the Percentage of deaths in the age-group 0-4 years to total deaths for India and bigger States/UTs.

Statement 51

Chart 99: Pecentage of deaths in the age group 0-4 years to total deaths, India and Bigger States/UTs, 2024

Death Rate for Children aged 0-4 years:

4.17 The death rates for children below age 5 by residence are given below in Statement 52 separately for males and females for the year 2024. In 2024, the death rate for children aged 0–4 years in India was 6.4 and was identical across both sexes. However, the death rate in rural areas (7.3) was much higher than the urban areas (4.2). Among the bigger States/UTs, Uttar Pradesh had the highest total death rate for children below 5 years of age at 10.3, with the highest male (10.6) and female (10.0) death rate. Kerala had the lowest total death rate at 1.6, with the male death rate at 1.5 and the female death rate at 1.6. Chart 100 to 102 shows Death rate for children age 0-4 years by sex for India and bigger States/UTs 2024 by place of residence viz, Total, Rural, and Urban respectively.

Under-5 Mortality Rate:

4.18 The Under-Five Mortality Rates by residence are given below in Statement 53 separately for males and females for the year 2024. The U5MR indicates the probability of a child dying before their fifth birthday, expressed as the number of deaths per 1,000 live births. For India, the U5MR was 28 in 2024, which means that out of every 1,000 live births, 28 children died before reaching the age of five. The U5MR is higher in rural areas (32) compared to urban areas (19). Among the bigger States/UTs, the U5MR ranges from 9 in Kerala to 41 in Madhya Pradesh and Uttar Pradesh for the year 2024. Kerala (9) had the lowest U5MR, followed by Delhi (13), Tamil Nadu (14), Himachal Pradesh, Jammu & Kashmir, and Maharashtra at 15 respectively. Madhya Pradesh and Uttar Pradesh (41) had the highest U5MR, followed by Chhattisgarh (39). The U5MR is either constant or higher in rural areas than in urban areas across most States/UTs, except in Kerala and West Bengal, where it is observed to be lower in rural areas. Chart 103 to 105 represents Under-Five Mortality Rates (U5MR) by sex for India & bigger States/UTs by place of residence viz, Total, Rural, and Urban respectively.

Survival to Age-5:

4.19 Survival to Age-5 or the Probability of Survival to Age-5 is defined as the probability that a child born during the specified year will survive till age 5, subject to current Age-Specific Mortality Rates. Survival to Age 5 or Probability of Survival to Age 5 is calculated as the complement of the Under-5 Mortality Rate. Probability of Survival to Age-5 by sex and residence for the year 2024 is given in statement 54 for India and bigger States/UTs. The probability of survival to Age 5 in the year 2024 was estimated at 0.972 for the country, and remains identical for both males and females. The Probability of Survival to Age 5 was estimated as 0.968 for Rural areas and 0.981 for Urban Areas during 2024. The probability of Survival to Age-5 varies from 0.959 in Madhya Pradesh and Uttar Pradesh to 0.991 in Kerala.

Adult Survival Rate:

4.22 Adult Survival rate is the probability of survival from age 15 to age 60, based on estimated mortality rates over this age range. The adult Survival Rate is calculated as a complement to the probability of dying between the age-group 15-59. The statement 57 below gives the Adult Survival Rates by sex and residence for India and bigger States/UTs of the Country. The Adult Survival Rate for Country was 0.874 in 2024 ranging from 0.809 in Chhattisgarh to 0.917 in Delhi. The Adult Survival Rate for male and female was 0.841 and 0.909 respectively. It was 0.865 for rural and 0.890 for urban areas of the Country during 2024.

Medical Attention before Death:

4.24 The type of medical attention received before death is also collected in the SRS. In the new samples from 2004 onwards, the options on types of medical attention received before death have been modified to capture the deaths occurred specifically at private hospital/nursing homes. The options include 'Government Hospital', 'Private Hospital', 'Qualified professional', 'Untrained functionary' and 'others'. The options for the sample based on 1991 sample were 'Institutional'; 'Medical attention other than Institution' and 'No medical attention'**.** Statement 59 given below presents the percentage distribution of deaths by type of medical attention received before death for India and bigger States/UTs separately for rural and urban areas for the year 2024. At the National level, 24.7% of deaths occurred in government hospitals, 15.5% occurred in private hospitals, 14.3% were attended by a qualified professional and 45.5% had no medical attention or were attended by an untrained functionary before death in 2024.

4.25 In rural areas, the percentage of deaths that occurred with no medical attention or an untrained functionary was higher at 48.9%, compared to 36.1% in urban areas. The distribution of deaths by type of medical attention received before death varies considerably across the States/UTs. For example, in Delhi, 36.9% of deaths occurred in government hospitals, while only 39.0% had no medical attention or were attended by an untrained functionary before death. In contrast, in Jharkhand, 61.8% of deaths occurred with no medical attention or an untrained functionary, while only 5.8% were attended by a qualified professional.

4.26 In case of rural areas, Untrained functionary & No medical attention received before deaths covers about 48.9% deaths ranging from 28.2% in Kerala to 68.9% in Bihar. While in urban areas, about 36.1% people have not received medical attention or attended by Untrained functionaries ranging from 22% in Karnataka to 57.9% in Bihar. Chart 115 to 117 represents distribution of deaths by Type of Medical Attention received before death for India, & bigger States/UTs by place of residence viz, Total, Rural, and Urban respectively.
